## **Introduction**

Project management is a multifaceted discipline that demands meticulous planning, strategic execution, and astute risk management to achieve successful outcomes. One of the most formidable challenges faced by project managers is the potential for cost overruns, which can significantly impact project budgets, timelines, and overall success. Cost overruns occur when actual project expenditures surpass the initially estimated costs, leading to financial strain, delayed deliverables, and stakeholder dissatisfaction.

The dynamic interplay between risk management and cost overruns forms the cornerstone of effective project execution. This guide delves into the symbiotic relationship between these two critical aspects, emphasizing the pivotal role of proactive risk management in mitigating the risk of cost overruns. By strategically identifying, assessing, and addressing risks that may lead to cost overruns, project managers can enhance their capacity to steer projects towards favorable outcomes.

*Analysis of Risks and Cost Overruns in Design-bid-build Highway Infrastructure Projects in Ontario* Lara Chahrour, 2017

Cost overruns commonly occur in infrastructure projects and when the owner is a government entity these overruns may disrupt the funding available for other projects Research on large projects indicates that actual project costs are on average 20% higher than estimates for road projects and 34% higher than estimates for tunnel and bridge projects Other studies that reiterate the presence of cost overruns report values between 3.9 and 10 percent Risk management can be used to identify and assess risks that may cause overruns and develop risk response plans to address them The objective of this research is to use risk management knowledge to identify and assess project risks and their expected impacts on highway infrastructure projects in Ontario The studied Ministry of Transportation of Ontario MTO projects have an average cost overrun of 5.2% of tender value for new construction projects and 11.5% for rehabilitation projects The risk identification and analysis is followed by a comparison between MTO's risk management experience and other typical North American organizations that are involved in transportation infrastructure such as Infrastructure Ontario and the California Department of Transportation as well as other contract delivery methods such as design build and public private partnerships From analyzing 986 risk events this research identifies design scope changes material and latent conditions as the main risks that appear to influence cost overruns for rehabilitation projects For new construction the main risks are design scope changes latent conditions and permits and regulations Once the risks are identified and analyzed action is required to manage the risks that are considered most important This thesis touches lightly on possible risk management actions for the identified risks

Project Management: The Managerial Process 6e Erik Larson, Clifford Gray, 2014-07-16 Project Management The Managerial Process 6e **Software Engineering Risk Management** Malte Sunderkötter, 2004-10-02 Research Paper undergraduate from the year 2004 in the subject Computer Science Commercial Information Technology grade 1 0 A University Karlsruhe TH Institute for Computer Science language English abstract While computer scientists have developed and provided several powerful computer languages and techniques in the last decades facilitating the development of modular maintainable and efficient code software development itself has changed fundamentally Software development today treats often with large scale projects immense development costs and complex systems which typically deploy multiple technologies and require multiple participants for their development As with any large development exercise the development of a complex system must be systematic and structured in order to manage this complexity and in order to make possible the future maintenance and evolution of the system Thus while systematic and structured approaches are necessary for the development of such systems software engineers have attempted to provide the structured methodologies and formalisms so often lacking in large software development projects However software development projects are still related with many different high risks These risks cause software engineering projects to exceed budget miss deadlines or deliver less than satisfactory products As an example U S companies alone spent an

estimated 59 billion in cost overruns on IT projects and another 81 billion on cancelled software projects in 1995 Johnson 1995 One reason for these high costs is that managers are not using adequate measures and executing efficient risk management assess and mitigate the risks involved in these projects Although risk taking is essential to progress and failure is often a key part of learning the inevitability of risks does not imply the inability to recognize and manage risks to minimize potential negative consequences while retaining the opportunities for creating new and better software Obviously this risk management process is particularly difficult for large scale software projects and be handled in the same way as for small project or just by providing more resources for all development factors
