Enumerative Combinatorics: Volume 2 Richard Stanley, 2023-08-17 Richard Stanley's two volume basic introduction to enumerative combinatorics has become the standard guide to the topic for students and experts alike This thoroughly revised second edition of volume two covers the composition of generating functions in particular the exponential formula and the Lagrange inversion formula labelled and unlabelled trees algebraic D finite and noncommutative generating functions and symmetric functions The chapter on symmetric functions provides the only available treatment of this subject suitable for an introductory graduate course and focusing on combinatorics especially the Robinson-Schensted-Knuth algorithm An appendix by Sergey Fomin covers some deeper aspects of symmetric functions including jeu de taquin and the Littlewood-Richardson rule The exercises in the book play a vital role in developing the material and this second edition features over 400 exercises including 159 new exercises on symmetric functions all with solutions or references to solutions

Harmonic Analysis on Semigroups C. van den Berg, J. P. R. Christensen, P. Ressel, 2012-12-06 The Fourier transform and the Laplace transform of a positive measure share together with its moment sequence a positive definiteness property which under certain regularity assumptions is characteristic for such expressions This is formulated in exact terms in the famous theorems of Bochner, Bernstein-Widder and Hamburger All three theorems can be viewed as special cases of a general theorem about functions $q_{j,k}$ on abelian semigroups with involution S which are positive definite in the sense that the matrix $q_{j,k} s_j s_k$ is positive definite for all finite choices of elements s_1, \dots, s_n from S The three basic results mentioned above correspond to $x \times 0$, $0 \times x$ and $N \times n$ The purpose of this book is to provide a treatment of these positive definite functions on abelian semigroups with involution In doing so we also discuss related topics such as negative definite functions, completely monotone functions and Hoeffding type inequalities We view these subjects as important ingredients of harmonic analysis on semigroups It has been our aim simultaneously to write a book which can serve as a textbook for an advanced graduate course because we feel that the notion of positive definiteness is an important and basic notion which occurs in mathematics as often as the notion of a Hilbert space

Probability Theory II Andrea Pascucci, 2024-09-02 This book offers a modern approach to the theory of continuous time stochastic processes and stochastic calculus The content is treated rigorously, comprehensively and independently In the first part the theory of Markov processes and martingales is introduced with a focus on Brownian motion and the Poisson process Subsequently the theory of stochastic integration for continuous semimartingales was developed A substantial portion is dedicated to stochastic differential equations, the main results of solvability and uniqueness in weak and strong sense, linear stochastic equations and their relation to deterministic partial differential equations Each chapter is accompanied by numerous examples This text stems from over twenty years of teaching experience in stochastic processes and calculus within master's

degrees in mathematics quantitative finance and postgraduate courses in mathematics for applications and mathematical finance at the University of Bologna The book provides material for at least two semester long courses in scientific studies Mathematics Physics Engineering Statistics Economics etc and aims to provide a solid background for those interested in the development of stochastic calculus theory and its applications This text completes the journey started with the first volume of Probability Theory I Random Variables and Distributions through a selection of advanced classic topics in stochastic analysis
