### -f output-file-format

Supported formats are generic/Intel/Motorola hex, and AVR Object files. There are two sub-variants of the AVR Object file format:

- Standard (V1) format, with 16-bit line number fields, supporting source files with up to 65534 lines
- Extended (V2) format, with 24-bit line number fields, supporting source files with up to ~16M lines

By default, when output format is unspecified or specified with `-FO`, the assembler will select the appropriate format automatically, V1 if the file has less than 65533 lines, V2 if it has more. The `-FO1` and `-FO2` options may be used to force V1 or V2 output file format regardless of number of lines.

If V1 file format is used with source files with more than 65534 lines, the assembler will issue a warning, and the lines above 65534 cannot be debugged with Arden Studio.

For all normal assembler projects, the default option should be safe. The extended format is primarily intended for machine-generated assembly files.

→

`-f` wrap relative jumps. This option is obsolete, because AVRASM2 automatically determines when to wrap relative jumps, based on program memory size. The option is recognized but ignored.
