Abstract

Since recent societies became more hooked into electricity, a higher level of power supply continuity is required from power systems. The expansion of those systems makes them liable to electrical faults and several failures are raised due to totally different causes, like the lightning strikes, power system element failure caused by mechanical aging as well as human mistakes. These conditions impact the stability of the power as well as lead to costly maintenance and loss of output.

This article examines the latest technologies and strategies to determine the location of faults in medium voltage distribution systems. The aim is to classify and assess different strategies in order to determine the best recommended models in practice or for further improvement. Several ways to locate failures in distribution networks have therefore been established. Because faults are unpredictable, quick fault location as well as isolating are necessary to reduce the impact of faults in distribution networks as well as removing the emergency condition from the entire system. This study also includes a comprehensive evaluation of several defect location methods depending on the algorithm employed, the input, the test system, the characteristics retrieved, and the degree of complexity. In order to gain further insight into the strengths and limitations of each method and also comparative analysis is carried out. Then the main problems of the fault location methods in distribution network are briefly expounded.

KEYWORDS: Distribution System, Fault location techniques, Transmission line Fault, Artificial intelligence, PMUs.

1. INTRODUCTION

Electrical networks include generating, transmission, and distribution networks. The distribution system is the final step in the transmission of power to individual consumers. Because of the rapid growth in human life demands over the last several decades, both power requirements, as well as the number of electric consumers, have expanded. As a result, distribution networks have had to expand distribution lines as well as feeders to meet consumer demand. As society is becoming more dependent on energy, more electric power reliability is needed, as is the development of innovative methods and techniques for detecting and locating problems and restoring power as quickly as feasible.

For several decades, companies and electricity generation specialists have studied the causes of power failures on power distribution systems. The principal cause for energy failures in electricity systems is electric failures, especially those in distribution systems (line-to-ground fault around 70%). These defects are caused by a variety of factors, such as failure of facilities, lightning, storms, harmful weather,

rain, breakdown of isolations, trees, birds and so on [1][2]. The fast and precise location of faults on the distribution system improves the reliability of the system and supply continuity, faster power supply recovery and therefore lower service shutdown times. Different strategies are being suggested to allow operational engineers to find the fault as quickly as feasible, based on the essential problems of failure location.

In contrast to distribution systems, much of the techniques for locating faults apply to transmission lines. Because of several parallel branches, several taps along with feeders, several conductors, and a complicated structure, besides from a lack of monitoring equipment, there is a lack of communication and information transportation systems so the locating faults in distribution systems is a difficult process [3]. In this study the most up-to-date technologies and categorize and analyze various techniques identifying location of the fault on distribution systems depending on the algorithm employed, the input, the test system, the characteristics retrieved, and the degree of complexity are
