Dictionary of Acronyms and Technical Abbreviations J. Vlietstra, Jakob Vlietstra, 1997 My first encounter with acronyms took place when I was ten years old and growing up in an occupied country during the Second World War My father proudly announced one day that despite the ban imposed by the occupying administration he had managed to get a radio installed and could receive the BBC All acronyms used in this introduction are listed in this dictionary To me the meaning of BBC was that we would receive different information about the war than we got from the usual censored broadcasts There was of course the well known acronym associated with the NT but at that time I did not realize that it meant more than the postal service in those years a deteriorated service Gradually the daily use of acronyms grew Most of the newly acquired three and four letter abbreviations referred to organizations such as the broadcasting corporations in The Netherlands and Belgium and references to countries such as the USA USSR and UK When attending high school the HBS after the war my knowledge of acronyms grew slowly Even during the ten years I spent in the Dutch Merchant Marine the GHV the number of acronyms was limited to advanced equipment that eventually became known as RADAR LORAN and DECCA

[Resource Provisioning and Dynamic Optimization of Network Slices in an SDN/NFV Environment](#) Nazih Salhab, 2020 To address the enhanced mobile broadband massive and critical communications for the Internet of things Fifth Generation 5G of mobile communications is being deployed nowadays relying on multiple enablers namely Cloud Radio Access Network C-RAN Software Defined Networking SDN and Network Function Virtualization NFV C-RAN decomposes the new generation Node B into i Remote Radio Head RRH ii Digital Unit DU and iii Central Unit CU also known as Cloud or Collaborative Unit DUs and CUs are the two blocks that implement the former 4G Baseband Unit BBU while leveraging eight options of functional splits of the front haul for a fine tuned performance The RRH implements the radio frequency outdoor circuitry SDN allows programming network s behavior by decoupling the control plane from the user plane and centralizing the flow management in a dedicated controller node NFV on the other hand uses virtualization technology to run Virtualized Network Functions VNFs on commodity servers SDN and NFV allow the partitioning of the C-RAN transport and core networks as network slices defined as isolated and

virtual end to end networks tailored to fulfill diverse requirements requested by a particular application. The main objective of this thesis is to develop resource provisioning algorithms for Central Processing Unit (CPU), memory, energy, and spectrum for 5G networks while guaranteeing optimal provisioning of Virtual Network Functions (VNFs) for a cloud-based infrastructure. To achieve this ultimate goal, we address the optimization of both resources and infrastructure within three network domains: 5G Core Network (5GC), C-RAN, and the SDN controllers. We first formulate the 5GC offloading problem as a constrained optimization to meet multiple objectives: virtualization cost, processing power, and network load, by making optimal decisions with minimum latency. We optimize the usage of the network infrastructure in terms of computing capabilities, power consumption, and bitrate while meeting the needs per slice: latency, reliability, efficiency, etc. Knowing that the infrastructure is subject to frequent and massive events such as the arrival/departure of users/devices, continuous network evolution/reconfigurations, and inevitable failures, we propose a dynamic optimization using Branch and Bound and Branch and Price, while discussing objectives/effects on multiple metrics. Our second contribution consists of optimizing the C-RAN by proposing a dynamic mapping of Remote Radio Heads (RRHs) to Baseband Units (BBUs), Distributed Units (DUs), and Core Units (CUs). On the first hand, we propose clustering the RRHs in an aim to optimize the downlink throughput. On the second hand, we propose the prediction of the Power Headroom (PHR) to optimize the throughput on the uplink. We formulate our RRHs clustering problem as k -dimensional multiple Knapsacks, and the prediction of PHR using different Machine Learning (ML) approaches to minimize the interference and maximize the throughput. Finally, we address the orchestration of 5G network slices through the software-defined C-RAN controller using ML-based approaches for all of classification of performance requirements, forecasting of slicing ratios, admission controlling, scheduling, and adaptive resource management. Based on extensive evaluations conducted in our 5G experimental prototype based on OpenAirInterface and using an integrated performance management stack, we show that our proposals outperform the prominent related strategies in terms of optimization speed, computing cost, and achieved throughput.
