Business policy and strategy A firm's business strategy defines how and where it competes, and its approach to doing so. A business strategy typically specifies a firm's goals, the products and services offered and the markets served, and the basis for competing (price, service, quality, etc.). A strategy may also define the organization structure, systems and policies which implement the strategy. In addition, firm's will have systems and policies which focus on operations and functions, and are not truly "strategic" in nature. Nevertheless, these operational policies can be important in determining business performance.

Business dynamics Business dynamics is the study of how the structure of a business (or a part of the business), the policies it follows, and its interactions with the outside world (customers, competitors, suppliers) determine its performance over time. Business structure consists of feedback loops surrounding the stocks and flows of resources, customers, and competitive factors that cause change over time; business policies are important components of these feedback loops. Business dynamics is a means of determining the likely performance that will result from alternative business policies and strategies.

Definition of the Subject

System dynamics has long been applied to problems of business performance. These applications range from operational/functional performance to overall strategic performance. Beginning with its founding at MIT's Sloan

School of Management in 1957, an important focus of research, teaching, and application has been on understanding why companies and markets exhibit cycles, or underperform competitors in terms of growth or profitability. The original publication in the field was Forrester's *Industrial Dynamics* [26], which not only laid the theoretical foundations for the field, but also provided an understanding of the causes of instability in supply chains. Since that initial work, research and application has been widespread. It has addressed the dynamics underlying instability in manufacturing and service organizations, the processes which encourage or inhibit growth, the dynamics of research organizations, and the causes of cost and schedule overruns on individual projects. It has been applied in many industries, from manufacturing to high-tech to financial services and utilities, both by academics and consultants. Business theory and applications are taught at many universities, including but not limited to MIT, London Business School and others in England, Bergen (Norway), Mannheim and Stuttgart (Germany) (see [62,72] for more details). Business policy and strategy has and will continue to be one of the major application areas for system dynamics.

Introduction

Business strategy, sometimes called simply 'policy' or 'strategy', is primarily concerned with how and where firm's choose to compete. It includes such decisions as setting goals, selecting which products and services to offer in which markets, establishing the basis for competing (price, service, quality, etc.), determining the organization structure, systems and policies to accomplish the strategy, and designing policies for steering that strategy continually into the future. Academic and applied research on business strategy developed separately from system dynamics. That research, while widely disparate, has largely focused on static assessments and tools. For example, cross-sectional studies of many companies attempt to identify key differences that determine success or failure as a guide to management; "strategic frameworks" (for example, learning curves, growth share matrices, Porter's five forces [79,80]) assist managers in framing strategy and intuitively assessing performance over time; scenario planning helps managers visualize alternative futures; the resource-based view of the firm and core competencies [81] help managers identify how resources and capabilities determine the best way to compete. While these tools provide valuable insights and frameworks, they leave the connection between a firm's business strategy and the evolution of its performance over time to the intuition of managers –

Scenario-Driven Planning Nicholas C. Georgantzas, William Acar, 1995-02-28 This book undertakes the following tasks

- 1 Charting the principal weakness of disconnected forecasts or wishes including their lack of compatibility both in substance and in terms of their implicit assumptions
- 2 Explaining the advantage of using internally coherent scenarios or scenario bundles
- 3 Explaining the advantage of using computed decision scenarios

These allow an examination of the joint consequences of changes in the environment and in a firm's strategy and not mistaking mere environmental hypothesizing for scenario driven planning
