

THE REAL AND  
COMPLEX NUMBER SYSTEMS

## 1.1 INTRODUCTION

Mathematical analysis studies concepts related in some way to real numbers, so we begin our study of analysis with a discussion of the real-number system.

Several methods are used to introduce real numbers. One method starts with the positive integers  $1, 2, 3, \dots$  as undefined concepts and uses them to build a larger system, the positive *rational numbers* (quotients of positive integers), their negatives, and zero. The rational numbers, in turn, are then used to construct the *irrational numbers*, real numbers like  $\sqrt{2}$  and  $\pi$  which are not rational. The rational and irrational numbers together constitute the real-number system.

Although these matters are an important part of the foundations of mathematics, they will not be described in detail here. As a matter of fact, in most phases of analysis it is only the *properties* of real numbers that concern us, rather than the methods used to construct them. Therefore, we shall take the real numbers themselves as undefined objects satisfying certain axioms from which further properties will be derived. Since the reader is probably familiar with most of the properties of real numbers discussed in the next few pages, the presentation will be rather brief. Its purpose is to review the important features and persuade the reader that, if it were necessary to do so, all the properties could be traced back to the axioms. More detailed treatments can be found in the references at the end of this chapter.

For convenience we use some elementary set notation and terminology. Let  $S$  denote a set (a collection of objects). The notation  $x \in S$  means that the object  $x$  is in the set  $S$ , and we write  $x \notin S$  to indicate that  $x$  is not in  $S$ .

A set  $S$  is said to be a *subset* of  $T$ , and we write  $S \subseteq T$ , if every object in  $S$  is also in  $T$ . A set is called *nonempty* if it contains at least one object.

We assume there exists a nonempty set  $\mathbf{R}$  of objects, called real numbers, which satisfy the ten axioms listed below. The axioms fall in a natural way into three groups which we refer to as the *field axioms*, the *order axioms*, and the *completeness axiom* (also called the *least-upper-bound axiom* or the *axiom of continuity*).

## 1.2 THE FIELD AXIOMS

Along with the set  $\mathbf{R}$  of real numbers we assume the existence of two operations, called *addition* and *multiplication*, such that for every pair of real numbers  $x$  and  $y$
