Geomorphology of Lake-Catchment Systems Kenji Kashiwaya, 2017-07-24
 This book presents the study of limnogeomorphology in which past proxy data such as lacustrine sediments with information on landform development can be linked to modern observed data acquired by instruments including hydro geomorphological and sedimentary data Traditionally in the field of earth sciences it has been thought that geophysical studies dealing mainly with the present process were not smoothly linked to geological studies that originated from historical studies Although such earth surface process studies are closely related to those on historical landform development in the field of geomorphology they have been studied separately Those two geomorphology studies correspond to process geomorphology dynamic geomorphology and historical geomorphology There have been some attempts to combine them however they lacked past quantitative records available for further analyses In the study of limnogeomorphology proxy data can be converted to quantitative information to be utilized in future environmental discussions This book also covers information not only on large lake catchment systems but on small systems Those include long term and short term and large scale and small scale environmental changes in east Eurasia such as Lake Baikal Lake Khuvsgul Lake Biwa and small lakes in Japan Mongolia China and Korea

Landscape Processes D. R. W. Weyman, 1977 *Landscape Processes* Darrell and Valerie Weyman, 2020-05-10 This book first published in 1977 is a concise fully illustrated introduction to modern geomorphology Geomorphologists pay much attention to the measurement of present day processes in attempting to develop explanations of landscape evolution and this book reflects this approach by deliberately emphasising processes in humid environments

Physical and Information Models in Geography (Routledge Revivals) Richard Chorley, Peter Haggett, 2013-10-14 First published in 1967 this book explores the theme of geographical generalization or model building It is composed of eight of the chapters from the original *Models in Geography* published in 1967 The first chapter broadly outlines geographical generalization and examines the nature and function of generalized statements ranging from conceptual models to scale models in a geographical context The following chapter deals with model theory in a wider scientific framework and the rest of the book discusses models of physical systems and information models The book considers model type generalizations that are applied in the three fields of geomorphology meteorology and climatology and hydrology before focusing on the transference of information and ideas in geography This text represents a robustly anti idiographic statement of modern work in one of the major branches of geography
