Inventorying Plug Load Equipment And Assessing Plug Load:

Energy Efficiency in Domestic Appliances and Lighting Paolo Bertoldi,2022-05-18 This book contains peer reviewed papers presented at the 10th International Conference on Energy Efficiency in Domestic Appliances and Lighting EEDAL 19 held in Jinan China from 6 8 November 2019 Energy efficiency helps to mitigate CO2 emissions and at the same time increases the security of energy supply Energy efficiency is recognized as the cleanest quickest and cheapest energy source Not only this but energy efficiency brings several additional benefits for society and end users such as lower energy costs reduced local pollution better outdoor and indoor air quality etc However in some sectors such as the residential sector barriers to investments in energy efficiency remain Legislation adopted in several jurisdictions EU Japan USA China India Australia Brazil etc helps in removing barriers and fosters investments in energy efficiency These initiatives complement innovative financing schemes for energy efficiency the provision of energy services by energy service companies and different types of information programs At the same time progress in appliance technologies and in solid state lighting offer high levels of efficiency LED lighting is an example As with previous conferences in this series EEDAL 19 provided a unique forum to discuss and debate the latest developments in energy and environmental impact of households including appliances lighting heating and cooling equipment electronics smart meters consumer behavior and policies and programs EEDAL addressed non technical issues such as consumer behavior energy access in developing countries and demand response

Plug Load Management System Field Study: Wireless Meter and Controls ,2018 This presentation offers background on GSA s Green Proving Ground GPG and DOE s High Impact Technology HIT Catalyst work and a field study that assessed a plug load management PLM system in two commercial building applications The Ibis InteliNetwork TM PLM system enables users to measure and analyze device energy use and identify opportunities for reduction of plug load energy use and set times for individual devices or groups of devices to turn off when not in use The presentation gives an overview of the PLM demonstration project its results and lessons learned Electric Plug Load Savings Potential of Commercial Foodservice Equipment Edward Ruan,Mark Finck,Denis Livchak,Michael Slater,Michael Karsz,David Zabrowski,Frontier Energy, Inc,2021 Plug Load Behavioral Change Demonstration Project Ian Metzger,2011 Any device that plugs into wall outlets

distributed throughout a building is a plug load. These loads do not relate to general lighting, heating, ventilation, cooling, or water heating and typically do not provide comfort to the occupants. This report documents the methods and results of a plug load study of the Environmental Protection Agency's Region 8 Headquarters in Denver, Colorado, conducted by the National Renewable Energy Laboratory. The study quantified the effect of mechanical and behavioral change approaches on plug load energy reduction and identified effective ways to reduce plug load energy. Load reduction approaches included automated energy management systems and behavioral change strategies.

Plug Load Management System with Load Identification, 2022. The present disclosure relates to a plug load management system having automatic and dynamic load detection meaning it has the ability to identify devices that are plugged into outlets of a building and determine the location of the plug load down to the specific outlet. When a device is moved, the plug load management system can determine this change and update accordingly.

Monitoring and Characterization of Miscellaneous Electrical Loads in a Large Retail Environment, 2014. Buildings account for 40% of primary energy consumption in the United States: residential 22%, commercial 18%. Most 70% residential and 79% commercial is used as electricity. Thus, almost 30% of U.S. primary energy is used to provide electricity to buildings. Plug loads play an increasingly critical role in reducing energy use in new buildings because of their increased efficiency requirements and in existing buildings as a significant energy savings opportunity. If all installed commercial building miscellaneous electrical loads (CMELs) were replaced with energy efficient equipment, a potential annual energy saving of 175 TWh or 35% of the 504 TWh annual energy use devoted to MELs could be achieved. This energy saving is equivalent to the annual energy production of 14 average sized nuclear power plants. To meet DOE's long term goals of reducing commercial building energy use and carbon emissions, the energy efficiency community must better understand the components and drivers of CMEL energy use and develop effective reduction strategies. These goals can be facilitated through improved data collection and monitoring methodologies and evaluation of CMELs energy saving techniques.

Plug and Process Loads Capacity and Power Requirements Analysis, 2014. This report addresses gaps in actionable knowledge that would help reduce the plug load capacities designed into buildings. Prospective building occupants and real estate brokers lack accurate references for plug and process load (PPL) capacity requirements so they often request 5-10 W/ft² in their lease agreements. Limited initial data, however, suggest that actual PPL densities in leased buildings are substantially lower. Overestimating PPL capacity leads designers to oversize electrical infrastructure and cooling systems. Better guidance will enable improved sizing and design of these systems, decrease upfront capital costs, and allow systems to operate more energy efficiently. The main focus of this report is to provide industry with reliable, objective, third-party guidance to address the information gap in typical PPL.
