Robust Control Engineering Mario Garcia-Sanz, 2017-06-26 This book thoroughly covers the fundamentals of the QFT robust control as well as practical control solutions for unstable time delay non minimum phase or distributed parameter systems plants with large model uncertainty high performance specifications nonlinear components multi input multi output characteristics or asymmetric topologies The reader will discover practical applications through a collection of fifty successful real world case studies and projects in which the author has been involved during the last twenty five years including commercial wind turbines wastewater treatment plants power systems satellites with flexible appendages spacecraft large radio telescopes and industrial manufacturing systems Furthermore the book presents problems and projects with the popular QFT Control Toolbox QFTCT for MATLAB which was developed by the author

Coefficient Diagram Method for Control System Design Shunji Manabe, Young Chol Kim, 2021-04-10 This book describes a new control design technique called Coefficient Diagram Method CDM whereby practical control engineers without deep control theories and mathematics background can design a good controller for their specific plants In addition control experts can solve some complicated design problems Since the CDM was first introduced in 1998 it reveals from the literature that CDM has provided successful controller designs for a variety of practical control problems In the last two

decades a great deal of research has been done on CDM while a growing number of researchers want to learn and utilize the method. However, there has been no textbook to learn it systematically so far. This book is motivated by such a need. It is also suitable as a textbook or reference book for master programs in control engineering.

Trajectory Optimization and Guidance Methods for Mars Entry Shuang Li, Xu Liu, Xiu-qiang Jiang, Yu-ming Peng, 2024-03-12. This book systematically investigates the Mars entry problem from the perspectives of deterministic optimization, uncertainty optimization, and guidance. Began with a detailed review of the robotic missions and human scaled exploration plans to Mars, theories or concepts of optimal control, uncertainty quantification, robust optimization, model predictive control, sequential convex programming, and computational guidance are subsequently introduced. Correspondingly, this book presents a series of trajectory planning and guidance algorithms to improve the robustness, reliability, and safety of the Mars missions. Because the Mars entry problem is studied using advanced mathematics including probability theory, optimization theory, and cybernetics, thus the book is primarily designed as a textbook for graduate students in aerospace engineering, aeronautics, and astronautics departments. Engineers and researchers may also use this book as a reference or tutorial to help with the modeling and simulation of the Mars entry problem due to its thorough simulations and analyses.

Advances in Gain-Scheduling and Fault Tolerant Control Techniques Damiano Rotondo, 2017-10-14. This thesis reports on novel methods for gain scheduling and fault tolerant control (FTC). It begins by analyzing the connection between the linear parameter varying (LPV) and Takagi-Sugeno (TS) paradigms. This is then followed by a detailed description of the design of robust and shifting state feedback controllers for these systems. Furthermore, it presents two approaches to fault tolerant control: the first is based on a robust polytopic controller design, while the second involves a reconfiguration of the reference model and the addition of virtual actuators into the loop. In addition, the thesis offers a thorough review of the state of the art in gain scheduling and fault tolerant control with a special emphasis on LPV and TS systems.

MATLAB/SIMULINK Toolbox for Spacecraft Attitude Control Simulation D. Schmitz, 2000. Guidance, Navigation, and Control for Spacecraft Rendezvous and Docking: Theory and Methods Yongchun Xie, Changqing Chen, Tao Liu, Min Wang, 2021-02-16. This book focuses on the theory and design methods for guidance, navigation, and control (GNC) in the context of spacecraft rendezvous and docking (RVD). The position and attitude dynamics and kinematics equations for RVD are presented systematically in accordance with several different coordinate systems, including elliptical orbital frame, and recommendations are supplied on which of these equations to use in different phases of RVD. The book subsequently explains the basic principles and relative navigation algorithms of RVD, sensors such as GNSS, radar, and camera type RVD sensors. It also provides guidance algorithms and schemes for different phases of RVD, including the latest research advances in rapid RVD. In turn, the book presents a detailed introduction to intelligent adaptive control and proposes corresponding theoretical approaches to thruster configuration and control allocation for RVD. Emphasis is placed on the design method of active and passive trajectory protection in different

phases of RVD and on the safety design of the RVD mission as a whole For purposes of verification the Shenzhou spacecraft s in orbit flight mission is introduced as well All issues addressed are described and explained from basic principles to detailed engineering methods and examples providing aerospace engineers and students both a basic understanding of and numerous practical engineering methods for GNC system design in RVD

Users' Guide to Programs for the Optimal Stationkeep and Attitude Control of Flexible Spacecraft N. A. C. Roger,1984 Principles of Spacecraft Control Walter Fichter,Ramin T. Geshnizjani,2022-10-11 The objective of this textbook is to provide the mathematical models and algorithms needed to develop a thorough understanding of all control system functions of a rigid body spacecraft Relatively simple but practically applicable algorithms are presented rather than recent advances We try to avoid detailed and specialized issues that are of less importance for the fundamental understanding such as detailed environment models etc Furthermore control problems that can be cast in standard formulations and solved with existing methods are not treated here Instead we intend to provide an understanding of the principles put them in an engineering context and try to give all explanations as concise as possible Besides conventional three axis attitude control systems the following topics are treated in this book Control of agile rotation maneuvers using control moment gyros Precise pointing control with error classes for pointing instruments Control systems with accelerometers and free flying test masses which provide low disturbance or disturbance free environments We believe that these topics are of considerable relevance for the design of future spacecraft control systems especially in the field of science and Earth observation missions
