## Abstract

In this paper we provide a short overview of the Radial Basis Functions (RBF), their properties, the motivations behind their use and some of their applications. RBF's have been employed for functional approximation in time-series modeling and in pattern classification. They have been shown to implement the Bayesian rule and to model any continuous input-output mapping. RBF's are embedded in a two-layer neural network topology. We present the physical and statistical significance of the elements composing the network. We introduce a few RBF training algorithms and we show how RBF networks can be used in real applications.

## 1 Introduction

Radial Basis Functions emerged as a variant of artificial neural network in late 80's. However, their roots are entrenched in much older pattern recognition techniques as for example potential functions, clustering, functional approximation, spline interpolation and mixture models [1]. RBF's are embedded in a two layer neural network, where each hidden unit implements a radial activated function. The output units implement a weighted sum of hidden unit outputs. The input into an RBF network is nonlinear while the output is linear. Their excellent approximation capabilities have been studied in [2,3]. Due to their nonlinear approximation properties, RBF networks are able to model complex mappings, which perceptron neural networks can only model by means of multiple intermediary layers [4].

In order to use a Radial Basis Function Network we need to specify the hidden unit activation function, the number of processing units, a criterion for modeling a given task and a training algorithm for finding the parameters of the network. Finding the RBF weights is called network training. If we have at hand a set of input-output pairs, called training set, we optimize the network parameters in order to fit the network outputs to the given inputs. The fit is evaluated by means of a cost function, usually assumed to be the mean square error. After training, the RBF network can be used with data whose underlying statistics is similar to that of the training set. On-line training algorithms adapt the network parameters to the changing data statistics [5,6]. RBF networks have been successfully applied to a large diversity of applications including interpolation [7,8], chaotic time-series modeling [5,9], systems identification, control engineering [10], electronic device parameter modeling, channel equalization [4,11,12], speech recognition [11,13], image restoration [14], shape-from-shading [15], 3-D object modeling [8,16], motion estimation and moving object segmentation [17], data fusion [18], etc.

This paper is structured as follows: in Section 2 we explain the network topology, in Section 3 we provide the RBF properties, while in Section 4 we describe some training algorithms for RBF networks. Some experimental results when applying RBF networks are provided in Section 5, while the conclusions of this study are drawn in Section 6.
