

Problem 2:

- (a) Prove that x is in the Cantor set iff x has a ternary expansion that uses only 0's and 2's.
- (b) The Cantor-Lebesgue function is defined on the Cantor set by writing x 's ternary expansion in 0's and 2's, switching 2's to 1's, and re-interpreting as a binary expansion. Show that this is well-defined and continuous, $F(0) = 0$, and $F(1) = 1$.
- (c) Prove that F is surjective onto $[0, 1]$.
- (d) Show how to extend F to a continuous function on $[0, 1]$.

Solution.

- (a) The n th iteration of the Cantor set removes the open segment(s) consisting of all numbers with a 1 in the n th place of the ternary expansion. Thus, the numbers remaining after n iterations will have only 0's and 2's in the first n places. So the numbers remaining at the end are precisely those with only 0's and 2's in all places. (Note: Some numbers have a non-unique ternary representation, namely those that have a representation that terminates. For those, we choose the infinitely repeating representation instead; if it consists of all 0's and 2's, it is in the Cantor set. This works because we remove an open interval each time, and numbers with terminating representations are the endpoints of one of the intervals removed.)
- (b) First, we show that this is well-defined. The only possible problem is that some numbers have more than one ternary representation. However, such numbers can have only one representation that consists of all 0's and 2's. This is because the only problems arise when one representation terminates and another doesn't. Now if a representation terminates, it must end in a 2 if it contains all 0's and 2's. But then the other representation ends with 12222... and therefore contains a 1.

Next we show F is continuous on the Cantor set; given $\epsilon > 0$, choose k such that $\frac{1}{3^k} < \epsilon$. Then if we let $\delta = \frac{1}{3^k}$, any numbers within δ will agree in their first k places, which means that the first k places of their images will also agree, so that their images are within $\frac{1}{3^k} < \epsilon$ of each other.

The equalities $F(0) = 0$ and $F(1) = 1$ are obvious; for the latter, $1 = 0.2222\dots$ so $F(1) = 0.1111\dots = 1$.

- (c) Let $x \in [0, 1]$. Choose any binary expansion of x , replace the 0's with 2's, and re-interpret as a ternary expansion. By part (a), this will produce a member of the Cantor set whose image is x . (Note: Their may be more than one preimage of x , e.g. $F(\frac{1}{3}) = F(\frac{2}{3}) = \frac{1}{2}$.)
- (d) First, note that F is increasing on the Cantor set C . Now let

$$G(x) = \sup\{F(y) : y \leq x, y \in C\}.$$

Note that $G(x) = F(x)$ for $x \in C$ because F is increasing. G is continuous at points not in C , because C is open, so if $x \in C$, there is a neighborhood of x on which G is constant. To show that G is continuous on C , let $x \in C$ and use the continuity of F (part b) to

Stein Real Analysis Solution:

An Introduction To Stein's Method Andrew Barbour, Louis Hsiao Yun Chen, 2005-04-14 A common theme in probability theory is the approximation of complicated probability distributions by simpler ones the central limit theorem being a classical example Stein's method is a tool which makes this possible in a wide variety of situations Traditional approaches for example using Fourier analysis become awkward to carry through in situations in which dependence plays an important part whereas Stein's method can often still be applied to great effect In addition the method delivers estimates for the error in the approximation and not just a proof of convergence Nor is there in principle any restriction on the distribution to be approximated it can equally well be normal or Poisson or that of the whole path of a random process though the techniques have so far been worked out in much more detail for the classical approximation theorems This volume of lecture notes provides a detailed introduction to the theory and application of Stein's method in a form suitable for graduate students who want to acquaint themselves with the method It includes chapters treating normal Poisson and compound Poisson approximation approximation by Poisson processes and approximation by an arbitrary distribution written by experts in the different fields The lectures take the reader from the very basics of Stein's method to the limits of current knowledge

Problems in Real Analysis Teodora-Liliana Radulescu, Vicentiu D. Radulescu, Titu Andreescu, 2009-06-12 Problems in Real Analysis Advanced Calculus on the Real Axis features a comprehensive collection of challenging problems in mathematical analysis that aim to promote creative non standard techniques for solving problems This self contained text offers a host of new mathematical tools and strategies which develop a connection between analysis and other mathematical disciplines such as physics and engineering A broad view of mathematics is presented throughout the text is excellent for the classroom or self study It is intended for undergraduate and graduate students in mathematics as well as for researchers engaged in the interplay between applied analysis mathematical physics and numerical analysis

Real Analysis Elias M. Stein, Rami Shakarchi, 2005-04-03 Real Analysis is the third volume in the Princeton Lectures in Analysis a series of four textbooks that aim to present in an integrated manner the core areas of analysis Here the focus is on the development of measure and integration theory differentiation and integration Hilbert spaces and Hausdorff measure and fractals This book reflects the objective of the series as a whole to make plain the organic unity that exists between the various parts of the subject and to illustrate the wide applicability of ideas of analysis to other fields of mathematics and science After setting forth the basic facts of measure theory Lebesgue integration and differentiation on Euclidian spaces the authors move to the elements of Hilbert space via the L_2 theory They next present basic illustrations of these concepts from Fourier analysis partial differential equations and complex analysis The final part of the book introduces the reader to the fascinating subject of fractional dimensional sets including Hausdorff measure self replicating sets space filling curves and Besicovitch sets Each chapter has a series of exercises from the relatively easy to the more complex that are tied directly to the text A substantial

number of hints encourage the reader to take on even the more challenging exercises As with the other volumes in the series Real Analysis is accessible to students interested in such diverse disciplines as mathematics physics engineering and finance at both the undergraduate and graduate levels Also available the first two volumes in the Princeton Lectures in Analysis

The Sub-Laplacian Operators of Some Model Domains Der-Chen Chang, Jingzhi Tie, 2022-08-01 The book constructs explicitly the fundamental solution of the sub Laplacian operator for a family of model domains in \mathbb{C}^n This type of domain is a good point wise model for a Cauchy Riemann CR manifold with diagonalizable Levi form Qualitative results for such operators have been studied extensively but exact formulas are difficult to derive Exact formulas are closely related to the underlying geometry and lead to equations of classical types such as hypergeometric equations and Whittaker's equations
