1.
 - a. The larger a cell becomes, the more demands it places on its DNA and the more trouble it has moving enough nutrients and wastes across the cell membrane.
 - b. As a cell grows, its surface area – to – volume ratio decreases.
 - c. As a cell's volume grows, its membrane needs more and more surface area to bring nutrients, oxygen, and water into the cell and move waste out. The cell's surface area – to – volume ratio shows how much area is available to move materials in and out of the cell compared to the cell's volume.
2.
 - a. Asexual reproduction is the production of offspring from only one parent. Sexual reproduction is the production of offspring from two parents.
 - b. Most animals and plants reproduce sexually, as do some single-celled organisms.
 - c. Asexual reproduction occurs rapidly, enabling a population to increase rapidly; however, the offspring are genetically identical and may not survive a change in the environment. Sexual reproduction takes longer, so a population doesn't grow fast; however, the offspring have a mix of genetic material from two parents that might help the population survive if the environment changes.

10.2 Assessment Answers

1.
 - a. Chromosomes are bundles of DNA that store most of a cell's genetic information.
 - b. Prokaryotic chromosomes are composed of a single, circular strand of DNA. Eukaryotic chromosomes are made up of DNA that is tightly wound around histone molecules. These DNA and protein structures pack together to form condensed coils.
2.
 - a. A series of events that a cell goes through as it grows and divides.
 - b. The S phase.
3.
 - a. During prophase, DNA in the nucleus condenses and the spindle begins to form. In metaphase, the chromosomes line up and spindle fibers attach to the centromeres.
 - b. The centromeres would not attach to the spindle, and the chromosomes could not be pulled apart during anaphase.
4.
 - a. Cytokinesis is the division of the cytoplasm and occurs at the end of cell division.
 - b. In animal cells, the cell membrane pinches in half to form two cells. In plant cells, a cell plate forms and gradually develops into cell membranes separating the daughter cells. Eventually a cell wall forms between the two daughter cells.
