

Hydrodynamic Thrust Bearing

4.1 Introduction

An axial load is termed as a thrust. There are many types of machinery where an end thrust is produced either from a reaction (i.e., ship's propeller) or as a dead load from a vertical shaft. The bearings, those are capable of carrying this type of load, are named as thrust bearings. A typical thrust bearing has been shown in Fig. 4.1, in which the thrust bearing consists of a rotating disk, fixed to the shaft, and a mating disk, fixed to the stationary hollow cylinder (shaded part). At first glance it appears that both the disks are parallel to each other, but in reality one of the disks has four to six inclined pads. The inclined pads form the required wedge (as explained in chapter 3, section 3.1.1). Due to relative motion between the disks, lubricating oil is sucked into wedge shaped zone over the taper land and forced out through reducing downstream clearance due to the generated hydrodynamic fluid pressure. The thrust load from the shaft is transferred to the stationary bearing part through the hydrodynamic oil film.
