**ABSTRACT**

As the accuracy of the electricity load forecast in the is crucial in providing better cost effective risk management plans, this paper proposes a Short Term Electricity Load Forecast (STLF) model with a high forecasting accuracy. A cascaded forward BPN neuro-wavelet forecast model is adopted to perform the STLF. The model is composed of several neural networks whose data are processed using a wavelet technique. The data to be used in the model is electricity load historical data. The historical electricity load data is decomposed into several wavelet coefficient using the Discrete wavelet transform (DWT). The wavelet coefficients are used to train the neural networks (NNs) and later, used as the inputs to the NNs for electricity load prediction. The Levenberg-Marquardt (LM) algorithm is selected as the training algorithm for the NNs. To obtain the final forecast, the outputs from the NNs are recombined using the same wavelet technique.

**Keywords** - STLF, BPN and DWT.

**I. INTRODUCTION**

Short term load forecasting (STLF) has taken over a vital role in the operation and planning of power systems since the price depends critically on the accuracy of a load forecast. Forecasting of electricity load demand on half hourly or hourly basis, from one day to many days ahead is referred as Short Term Load Forecasting (STLF).

The aim of STLF is to predict the future electricity load based on the recognition of similar repeating trends of patterns from historical load data [1]. Normally, there are two different methods of forecasting models - the traditional models and the modern techniques.

web a double tuned amplifier consists of inductively coupled two tuned circuits one  $L_1 C_1$  and the other  $L_2 C_2$  in the collector terminals a change in the coupling of the two tuned circuits results in change in the shape of the frequency response curve by proper adjustment of the coupling between the two coils of the two tuned circuits the

**what is the difference between single tuned and double tuned** - Sep 21 2023

web nov 27 2019 single tuned amplifiers use one parallel resonant circuit as the load impedance in each stage and all the tuned circuits are tuned to the same frequency double tuned amplifiers use two inductively coupled tuned circuits per stage both the tuned circuits being tuned to the same frequency

**double tuned amplifier wikipedia** - May 17 2023

web a double tuned amplifier is a tuned amplifier with transformer coupling between the amplifier stages in which the inductances of both the primary and secondary windings are tuned separately with a capacitor across each the scheme results in a wider bandwidth and steeper skirts than a single tuned circuit would achieve
