

Answer Key

SECTION 1. THE CELL CYCLE

Cell Cycle: (1) G₁/S (G₂) - cells grow, carry out normal functions, and copy their organelles; (2) Synthesis (S) - cells replicate DNA; (3) G₂/M (G₂) - cells go through additional growth; (4) Mitosis (M) - cells undergo cell division, which involves both the processes of mitosis and cytokinesis.

1. At the time that these stages were named, scientists could not observe any activity going on in cells, so they thought there were gaps in cellular activity.
 2. G₁ and G₂
 3. in the nucleus
 4. nucleus and cytoplasm
 5. G₂
 6. The rate of cell division is linked to the body's need for that cell type. Skin cells are typically required to meet damaging conditions and must be replaced more often than liver cells.
7. The name that some scientists give to the stage where cells carry out their normal functions but are ready to divide.
8. Answers will vary. Sample answer: Cell size is limited because all substances must cross the membrane. Enough material needs to enter and exit to keep the cell alive. Since volume tends to increase faster than surface area (in a sphere or cube), the volume could quickly become too large compared to the area available for exchange. In a similar way, people in a very large building that lacks windows might not be able to exit quickly in an emergency. People in a smaller building that exits from people could probably exit more quickly.
 9. volume
 10. growth and division
11. Answers will vary, but should relate the occurrence of something (steps, phases, the end of a wheel) to the repeating pattern of growth, DNA duplication, and cell division that occurs in eukaryotic cells.
12. cytokinesis, cyto - refers to a cell and kinesis refers to division or movement.

13. telomere

SECTION 2. MITOSIS AND CYTOKINESIS

1. one long-continuous strand of DNA that has many genes and regulatory information
2. so they can be more easily divided between the two nuclei
3. Proteins need to be able to access genes during other stages of the cell cycle so that they can be used to make proteins so that the entire DNA sequence can be copied.

DNA Diagram: Refer to Figure 2.2 for visual answer.
4. During interphase, a cell duplicates its DNA and organelles.
 5. body cells
 6. Answers will vary. Sample answer: Pat's mass can increase.

Cycle Diagram: Refer to Figure 2.4 for visual answer. Labels (clockwise): metaphase, anaphase, telophase
7. In animal cells, the microtubule pinches together, forming a cleavage furrow. In plant cells, the microtubule cannot pinch together because of the cell wall. Instead, a cell plate is laid down between the two nuclei, which will develop into the new cell walls and cell membranes.
 8. telomere
 9. chromosome
 10. chromosome
 11. telomere

SECTION 3. REGULATION OF THE CELL CYCLE

1. cell division
2. platelet-derived growth factor
3. specific cells
4. cyclins
5. kinases
6. phosphorylate
