Antibacterial Agents Rosaleen Anderson, Paul W. Groundwater, Adam Todd, Alan Worsley, 2012-07-23 Antibacterial agents act against bacterial infection either by killing the bacterium or by arresting its growth They do this by targeting bacterial DNA and its associated processes attacking bacterial metabolic processes including protein synthesis or interfering with bacterial cell wall synthesis and function Antibacterial Agents is an essential guide to this important class of chemotherapeutic drugs Compounds are organised according to their target which helps the reader understand the mechanism of action of these drugs and how resistance can arise The book uses an integrated lab to clinic approach which covers drug discovery source or synthesis mode of action mechanisms of resistance clinical aspects including links to current guidelines significant drug interactions cautions and contraindications prodrugs and future improvements Agents covered include agents targeting DNA quinolone rifamycin and nitroimidazole antibacterial agents agents targeting metabolic processes sulfonamide antibacterial agents and trimethoprim agents targeting protein synthesis aminoglycoside macrolide and tetracycline antibiotics chloramphenicol and oxazolidinones agents targeting cell wall synthesis Lactam and glycopeptide antibiotics cycloserine isoniazid and daptomycin Antibacterial Agents will find a place on the bookshelves of students of pharmacy pharmacology pharmaceutical sciences drug design discovery and medicinal chemistry and as a bench reference for pharmacists and pharmaceutical researchers in academia and industry

Biochemical Tests for Identification of Medical Bacteria Jean F. Mac Faddin,1980 Artificial Intelligence in Pathogenic Microorganism Research Chen Li,Yu-Dong Yao,Marcin Grzegorzec,2025-05-26 Infections caused by pathogenic microorganisms including bacteria viruses fungi and other eukaryotic microbes seriously threaten human health Traditional research methods and laboratory techniques have many limitations and focus more on the identification and classification of pathogenic microorganisms In recent years technologies such as whole genome sequencing and advanced bioinformatics analysis have promoted the research of pathogenic microorganisms However with the interplay of multiple factors like global climate change ecological and environmental changes urbanization social behavior and lifestyle changes pathogenic microorganisms transmission patterns and impact scope are gradually changing There is an urgent need for

multidimensional technological approaches to achieve epidemiological monitoring and evolutionary direction prediction of pathogenic microorganisms. Additionally, more robust data processing and analysis capabilities are required for rapid identification and diagnosis, monitoring of drug resistance, development of antimicrobial drugs and vaccines, and optimization of treatment plans. Therefore, Artificial Intelligence (AI) has entered our field of vision. In the field of pathogenic microorganisms, AI has shown tremendous potential. In epidemiological research, AI technology can quickly and automatically collect, integrate, and analyze the epidemic data of infectious diseases from different regions so as to predict the trend and scope of disease transmission and track the source of infection. In the process of diagnosis and treatment of infectious diseases, machine learning can not only analyze the microscopic images of pathogens but also analyze the genome sequences of multiple pathogens in a short time and predict their sensitivity or resistance to specific antibiotics, greatly improving the efficiency and accuracy of diagnosis and treatment of infectious diseases. In drug or vaccine development, researchers can use AI models to predict efficient antigens for diseases such as HIV and influenza and thus design more effective vaccine candidates. AI models can also analyze the interactions between drugs, pathogens, and patients in order to design the optimal dosing regimen for each patient. In a word, AI can help human beings better deal with infectious diseases. We welcome original reviews, articles, and other contributions in related fields which mainly include the following aspects:

- 1 The application of AI in the differential diagnosis of pathogenic microorganisms
- 2 The application of AI in the formulation of anti-infection treatment plans
- 3 The application of AI in monitoring and predicting the prevalence of pathogenic microorganisms
- 4 Application of AI in the prediction and prevention of infectious diseases caused by pathogenic microorganisms
- 5 The application of AI in the research and development of anti-infective drugs and vaccines
