

Exercise Short Answers

Q:1 What are hydrothermal vents?

Ans: Hydrothermal vents: These are underwater hot springs, deep in the oceans and are considered to be related with the origin of life on earth.

- These vents could have supplied the energy and raw materials for the origin and survival of early life form.
- A group of bacteria, called archaeobacteria, that tolerate temperature up to 120°C and seem to have undergone less evolutionary change than any other living species support this vent hypothesis.

Q:2 State endosymbiont hypothesis.

Ans: Endosymbiont hypothesis: The eukaryotic cell might have evolved when a large anaerobic (living without oxygen) amoeboid prokaryote ingested small aerobic (living with oxygen) bacteria and stabilized them instead of digesting them. This idea is known as endosymbiont hypothesis.

- This idea was proposed by Lynn Margulis.
- According to this hypothesis, the aerobic bacteria develop into mitochondria which are site aerobic respiration and most energy conversion in eukaryotic cells. The possession of these mitochondria like endosymbiont brought the advantage of aerobic respiration to the host.
- The flagella have arisen through the ingestion of spirochetes.
- Ingestion of spirochete like prokaryotes like cyanobacteria would have been developed into chloroplasts in plants.

Q:3 Define population genetics.

Ans: Population genetics: The total aggregate of genes in a population at any one time is called population gene pool and such study is called population genetics.

OR

Population genetics is the study of genetic variation within populations, and involves the examination and modeling of changes in the frequencies of genes and alleles in populations over space and time.

Q:4 How does fossil record provide evidence of evolution?

Ans: Fossils: The fossils are either actual remains or traces of organisms or impressions made by the body parts of organisms that lived in ancient times.

Fossil record as evidence of evolution:

- The succession of fossil forms is strong evidence in favor of evolution. It provides a visual record in a complete series showing the evolution of an organism.
- Evidence from biochemistry, biology and cell biology places prokaryotes as ancestors of all life and predicts that bacteria should precede all eukaryotic life in fossil record. Indeed the oldest known fossils are prokaryotes.
- Another evidence is the chronological appearance of different classes of vertebrate animals in fossil record. Fossil record shows that fishes were the first vertebrates to appear in the world, the amphibians next, then the reptiles come and then birds and mammals exist. This sequence is consistent with the history of vertebrate descent. The evolution of horse provides an example of such history.

Q:5 Explain the term homology with a suitable example.

Ans: Homology: The similarity in characteristics resulting from common ancestry is known as homology.

Example: For example fore limbs of man, bat horse and whale etc. are result of homology.

Q:6 What are vestigial organs? Give two examples.

Ans: Vestigial organs: Vestigial organs are historical remnants of structures that had important functions in ancestors but no longer essential presently and are supposed to be functional in remote past.

OR

The oldest homologous structures are vestigial organs, rudimentary structures that had important functions in ancestors are not important now.

Examples:

The examples of vestigial organs are vermiform appendix in carnivores, ear muscles in man.
