

## Presenting Data

To seek answers to problems or questions they have about the world, scientists typically perform many experiments in the laboratory. In doing so, they observe physical characteristics and processes, select areas for study, and review the scientific literature to gain background information about the topic they are investigating. They then form hypotheses, test these hypotheses through controlled experiments, record and analyze data, and develop a conclusion about the correctness of the hypotheses. Finally, they report their findings in detail, giving enough information about their experimental procedure so that other scientists are able to replicate the experiments and verify the results.

The Laboratory Investigations in Laboratory Manual B provide an opportunity for you to investigate scientific problems in the same manner as that of a typical scientist. As you perform these investigations, you will employ many of the techniques and steps of the scientific method a working scientist does. Some of the most important skills you will acquire are associated with the step of the scientific method known as recording and analyzing data. Three of these skills are creating and filling in data tables, making drawings, and finding averages. Another set of skills useful in presenting data is examined in the Laboratory Skills activity titled Using Graphing Skills.

It is important to record data precisely—even if the results of an investigation appear to be wrong. And it is extremely important to keep in mind that developing laboratory skills and data analysis skills is actually more valuable than simply arriving at the correct answers. If you analyze your data correctly—even if the data are not perfect—you will be learning to think as a scientist thinks. And that is the purpose of this laboratory manual and your experience in the biology laboratory.

### Data Tables

When scientists conduct various experiments and do research, they collect vast amounts of information: for example, measurements, descriptions, and other observations. To communicate and interpret this information, they must record it in an organized fashion. Scientists use data tables for this purpose.

You will be responsible for completing data tables for many of the Laboratory Investigations. Each column in a data table has a heading. The column headings explain where particular data are to be placed. The completed data tables will help you interpret the information you collected and answer the questions found at the end of each Laboratory Investigation.
