with only the hybrid root pass and completed joints root and filling passes were evaluated Hardness mapping revealed as the critical area the top portion of hybrid laser fusion zone which was subsequently reheated by the GMAW filling pass Optical and scanning electron microscopy revealed a bainitic martensitic microstructure with the proportion of those two phases varying as a function of the preheating Miniaturized Charpy V notch testing was used to evaluate the local toughness and ductile to brittle transition of several regions within the joint Fractographic analysis confirmed the abrupt transition from ductile to brittle behavior The localized fracture toughness testing showed an adequate joint performance for all tested conditions Nevertheless the hardness values meet the requirements only for higher preheating temperature conditions
