

# Quantitative Risk Management

*Concepts, Techniques and Tools* Revised Edition

by Alexander J. McNeil, Rüdiger Frey & Paul Embrechts

*Praise for the previous edition: "This book provides a state-of-the-art discussion of the three main categories of risk in financial markets, market risk, . . . credit risk . . . and operational risk. . . . This is a high level, but well-written treatment, rigorous (sometimes succinct), complete with theorems and proofs."*

—D.L. McLeish, Short Book Reviews of the International Statistical Institute

*Praise for the previous edition: "A great summary of the latest techniques available within quantitative risk measurement. . . . [I]t is an excellent text to have on the shelf as a reference when your day job covers the whole spectrum of quantitative techniques in risk management."*

—Financial Engineering News

This book provides the most comprehensive treatment of the theoretical concepts and modelling techniques of quantitative risk management. Whether you are a financial risk analyst, actuary, regulator or student of quantitative finance, *Quantitative Risk Management* gives you the practical tools you need to solve real-world problems.

Describing the latest advances in the field, *Quantitative Risk Management* covers the methods for market, credit and operational risk modelling. It places standard industry approaches on a more formal footing and explores key concepts such as loss distributions, risk measures and risk aggregation and allocation principles. The book's methodology draws on diverse quantitative disciplines, from mathematical finance and statistics to econometrics and actuarial mathematics. A primary theme throughout is the need to satisfactorily address extreme outcomes and the dependence of key risk drivers. Proven in the classroom, the book also covers advanced topics like credit derivatives.

- Fully revised and expanded to reflect developments in the field since the financial crisis
- Features shorter chapters to facilitate teaching and learning
- Provides enhanced coverage of Solvency II and insurance risk management and extended treatment of credit risk, including counterparty credit risk and CDO pricing
- Includes a new chapter on market risk and new material on risk measures and risk aggregation

**Alexander J. McNeil** is professor of actuarial mathematics and statistics at Heriot-Watt University in Edinburgh. **Rüdiger Frey** is professor of mathematics and finance at the Vienna University of Economics and Business. **Paul Embrechts** is professor of mathematics at the Swiss Federal Institute of Technology in Zurich.

**Interest Rate Risk Models** Anthony G. Cornyn, 1997 Practical guide for asset liability managers faced with the decision as to whether to build or buy a financial model. Topics include modeling cash flows, net investment income versus net portfolio value, projections of interest rates and volatility. A guide for asset liability managers and other investment professionals who are faced with the decision of whether to build or buy a financial model to measure, monitor, and help manage their institution's risk exposure. It reviews the evolution of interest rate risk models and evaluates the state of the art models in use. Includes modeling cash flows, modeling the term structure, OAS technology, net interest income versus net portfolio value, build versus buy analysis, practical methods for deriving input assumptions, prepayment rates, deposit decay rates, projections of interest rate and volatility.

**The Oxford Handbook of Credit Derivatives** Alexander Lipton, Andrew Rennie, 2013-01-17 From the late 1990s the spectacular growth of a secondary market for credit through derivatives has been matched by the emergence of mathematical modelling analysing the credit risk embedded in these contracts. This book aims to provide a broad and deep overview of this modelling covering statistical analysis and techniques, modelling of default of both single and multiple entities, counterparty risk, Gaussian and non Gaussian modelling and securitisation. Both reduced form and firm value models for the default of single entities are considered in detail with extensive discussion of both their theoretical underpinnings and practical usage in pricing and risk. For multiple entity modelling the now notorious Gaussian copula is discussed with analysis of its shortcomings as well as a wide range of alternative approaches including multivariate extensions to both firm value and reduced form models and continuous time Markov chains. One important case of multiple entities modelling counterparty risk in credit derivatives is further explored in

two dedicated chapters Alternative non Gaussian approaches to modelling are also discussed including extreme value theory and saddle point approximations to deal with tail risk Finally the recent growth in securitisation is covered including house price modelling and pricing models for asset backed CDOs The current credit crisis has brought modelling of the previously arcane credit markets into the public arena Lipton and Rennie with their excellent team of contributors provide a timely discussion of the mathematical modelling that underpins both credit derivatives and securitisation Though technical in nature the pros and cons of various approaches attempt to provide a balanced view of the role that mathematical modelling plays in the modern credit markets This book will appeal to students and researchers in statistics economics and finance as well as practitioners credit traders and quantitative analysts

*High Risk Scenarios and Extremes* A. A. Balkema, Paul Embrechts, 2007 Quantitative Risk Management QRM has become a field of research of considerable importance to numerous areas of application including insurance banking energy medicine reliability Mainly motivated by examples from insurance and finance the authors develop a theory for handling multivariate extremes The approach borrows ideas from portfolio theory and aims at an intuitive approach in the spirit of the Peaks over Thresholds method The point of view is geometric It leads to a probabilistic description of what in QRM language may be referred to as a high risk scenario the conditional behaviour of risk factors given that a large move on a linear combination portfolio say has been observed The theoretical models which describe such conditional extremal behaviour are characterized and their relation to the limit theory for coordinatewise maxima is explained The book is based on a graduate course on point processes and extremes It could form the basis for an advanced course on multivariate extreme value theory or a course on mathematical issues underlying risk Students in statistics and finance with a mathematical quantitative background are the prime audience Actuaries and risk managers involved in data based risk analysis will find the models discussed in the book stimulating The text contains many indications for further research
