Big Data Analytics in Cybersecurity Onur Savas, Julia Deng, 2017-09-18 Big data is presenting challenges to cybersecurity. For an example, the Internet of Things (IoT) will reportedly soon generate a staggering 400 zettabytes (ZB) of data a year. Self-driving cars are predicted to churn out 4000 GB of data per hour of driving. Big data analytics, as an emerging analytical technology, offers the capability to collect, store, process, and visualize these vast amounts of data. Big Data Analytics in Cybersecurity examines security challenges surrounding big data and provides actionable insights that can be used to improve the current practices of network operators and administrators. Applying big data analytics in cybersecurity is critical. By exploiting data from the networks and computers, analysts can discover useful network information from data. Decision makers can make more informative decisions by using this analysis, including what actions need to be performed and improvement recommendations to policies, guidelines, procedures, tools, and other aspects of the network processes. Bringing together experts from academia, government laboratories, and industry, the book provides insight to both new and more experienced security professionals, as well as data analytics professionals who have varying levels of cybersecurity expertise. It covers a wide range of topics in cybersecurity, which include Network forensics, Threat analysis, Vulnerability assessment, Visualization, Cyber training. In addition, emerging security domains such as the IoT, cloud computing, fog computing, mobile computing, and cyber social networks are examined. The book first focuses on how big data analytics can be used in different aspects of cybersecurity, including network forensics, root cause analysis, and security training. Next, it discusses big data challenges and solutions in such emerging cybersecurity domains as fog computing, IoT, and mobile app security. The book concludes by presenting the tools and datasets for future cybersecurity research.

analysis incident response and threat hunting tools to detect malware attacker command lines network connections and more Resource description page *Using AI Guided Threat Hunting to Provide Improved Context for Prioritization and Response to Cyber Security Incidents* Michael A. Wisniewski,2021 Air Force Threat Hunting has primarily been reactive in nature and techniques for identification are slowly becoming more antiquated As an example the primary response to a perceived threat has been to block the IP space or the Web Domain While this approach does effectively prevent systems from communicating with the perceived threat with the development of domain generation algorithms DGAs advance attackers are able to easily sidestep block lists and we just end up playing an epic game of whack a mole The significant consequence of this type of response impacts the computing power of our protecting edge devices as they will need to expend significant resources to maintain the growing block lists as well as query the large list for comparison Other hunting techniques apply rule based approaches which leaves them open to attacks which do not match the rules such as say zero day attacks and automated systems place too much importance on any changes in behavior which tend to create more false positives than analysts can effectively process By incorporating Machine Intelligence into our Threat Hunting tool kits we could potentially overcome some of the previously mentioned challenges For the purposes of this paper I intend to primarily focus on the development of Rank Aggregation and some of the tools available to provide improved context for prioritization and response Page 3
