Sunspot Analysis Lab

Introduction: Photographs of the sun show dark areas on its surface which are believed to be due to magnetic storms that take place within the sun. These spots are actually very bright, however they appear darker than the surrounding areas on the Sun because they are cooler. The number and pattern of these spots change with time.

When the data collected over many of years are graphed, a pattern emerges. This picture-like representation makes it easier to see relationships that are not obvious from a column of numbers.

Objective: You will see how graphing data can aid in deciphering patterns and predicting future events.

Vocabulary: Using the vocabulary terms found in your notes, fill in the following blanks with the correct terms.

When you are graphing data you always plot the _____ variable on the x-axis. The variable that is being measured is known as the _____ variable and is plotted on the y-axis.

After the data is plotted a pattern can sometimes emerge. If there is a connection, or relationship, between two or more pieces of data we say there is a _____ between the variables. If a relationship occurs between variables you can use data to make predictions about the future. This is known as _____. There are several types of relationships that can emerge when you graph data. A _____

relationship is when an increase in one variable results in an increase in the other variable, while an _____ relationship is when an increase in one variable results in the decrease of another variable. If there is a repeating pattern we say there is a _____ relationship between the data.

Procedure:

1. Using an X, plot the data found in the table on the following page on graph found on page three. After you have plotted all the data points, connect each X with a smooth line.
2. Using the data given, graph the number of sunspots in the years from 1995 into 2009.
