Harness Production Cables Cable Processing Systems:

Optimal Flow Control in Manufacturing Systems O. Maimon, E. Khmelnitsky, K. Kogan, 2013-03-09 This book presents a unified optimal control approach to a large class of problems arising in the field of production planning and scheduling. It introduces a leading optimal flow control paradigm which results in efficient solutions for planning and scheduling problems. This book also introduces the reader to analytical and numerical methods of the maximum principle used here as a mathematical instrument in modeling and solving production planning and scheduling problems. The book examines control of production flows rather than sequencing of distinct jobs. Methodologically, this paradigm allows us to progress from initial assumptions about a manufacturing environment through mathematical models and construction of numerical methods up to practical applications which prove the relevance of the theory developed here to the real world. Given a manufacturing system, the goal is to control the production subject to given constraints in such a way that the demands are tracked as closely as possible. The book considers a wide variety of problems encountered in actual production planning and scheduling. Among the problems are production flow sequencing and timing, capacity expansion and deterioration, subcontracting and overtime. The last chapter is entirely devoted to applications of the theory to scheduling production flows in real life manufacturing systems. The enclosed disk provides software implementations of the developed methods with an easy, convenient user interface. We aimed this book at a student audience: final year undergraduates as well as master and Ph D.

Knowledge-Based Process Planning for Construction and Manufacturing Carlos Zozaya-Gorostiza, 2012-12-02 Knowledge Based Process Planning for Construction and Manufacturing describes a knowledge based system architecture that is used to develop process planning systems called PLANEX. This book explains that PLANEX is a domain independent knowledge based process planning system architecture. Starting from a description of the physical artifact to be constructed or manufactured, PLANEX generates the set of activities used to create the artifact. These activities with their required resources are linked into a process planning network which can be used in project scheduling or management. This text also reviews the concepts, requirements, and resulting architecture of PLANEX, including detailed descriptions of applications of the system in construction and manufacturing. This publication is recommended to engineers, architects, and specialists interested in construction and manufacturing process planning.
