INTRODUCTION: Videos are recognized by their power and great flexibility as teaching tools. Studies about using videos in medical education defend its association with innovation, emotional impact, entertainment, self evaluation, and skills acquisition. However, the expansion of video use at health education can be inhibited by requirements of infrastructure, cost of equipments and lack of human resources. The new generation of camcorders, called action cameras, could be alternatives to those restrictions, because could offer autonomy and simplicity to produce educational videos. Ease to use and with low cost, these cameras capture images in first person point of view (POV), allowing innovative and creative filmages. Our work presents the experience of using action cameras in a surgical center, specifically in neurosurgical procedures, allowing visualization in real time and post surgical discussions (clinical rounds) by neurosurgeons, neurosurgery residents and medical interns.

METHODS: Since January 2015 we have been using two action cameras GoPro Hero 3+ Black Edition in neurosurgical procedures, both skull and spine surgeries, in the Botucatu Medical School Clinical Hospital (FMB), UNESP.

RESULTS: Neurosurgery residents, along with the lead surgeon responsible for the procedure, make a previous analysis of the weekly procedures, choosing interesting or uncommon scheduled surgeries. The surgical procedure choice is made by consensus, involving professors and neurosurgeons of the Neurology, Psychiatry and Psychology department, accompanied by the residents and interns. After choosing the procedures, the department responsible for the maintenance of the action cameras are notified of the weekly schedule to prepare and charge the cameras. On the day before the patients are asked for the permission of footage and documentation of the procedures, signing a free and clarified consent term. During the surgical procedures one resident use one camera on a headband strap to POV recording and the other camera are positioned in a surgical light focus or a tripod, for wide room footage allowing analysis of the staff and resident positioning and later for example. One other resident or intern follow the cameras by a tablet (Apple Ipad), outside the surgical field, for proper camera positioning and battery or memory checks. The surgical procedures had lengths from 2 to 8 hours long. After the procedure the videos and pictures are edited with Apple's Final Cut Pro X (Version 10.1.3) and stored on a cloud server, like dropbox or google drive, sharing throughout all professionals involved for further analysis. All edited videos are presented on the monday Grand Rounds and discussed looking for technical nuances and possible mistakes during surgery (like aneurysm intraoperative bleedings) allowing future better surgical planning.
