What is dynamic programming and how does it work at a high level?

Dynamic programming is simply an optimization over plain recursion. Whenever we see a recursive solution for the same inputs, we can optimize it using Dynamic programming. The main idea is to simply store the results of the sub-problems so that we don't need to recompute them when they are needed later.

At a high level, you are looking at all the possible first choices, recursively solving them and then picking the best one.

What is the weighted activity selection problem and how would you solve it with dynamic programming? Explain the following:

- What is  $P(i)$ ?

- What is the recurrence relation?

In the weighted activity selection problem, you have  $n$  events  $e_1, e_2, \dots, e_n$ . For each event, you have the start time  $s_i$ , finish time  $f_i$ , and the reward which is  $r_i$ . What we want to do is find a non-conflicting subset of events with the highest reward.

- The way we approach it with dynamic programming is by considering what you want to schedule last. But since we don't have a greedy strategy, we consider every possible choice for that last position.

- If you have an event  $e_i$  that you are considering for the last position, you are removing everything after  $e_i$  and you are removing anything that is conflicting with  $e_i$ .  $P(i) = j$  means that there has to be some event  $e_1$  to  $e_j$  that are left in the subproblem

- Define  $M(j)$  as the best reward we can get from the first  $j$  events and we ultimately want to compute  $M(n)$

- The recurrence relation is  $M(n) = \max(r_i) + M(p(i))$ .  $r_i$  is the reward from event  $e_i$

*Elements of Competitive Programming : Dynamic Programming: 88 Problems with Solutions (A Functional Approach)*

Chandra Shekhar Kumar,2022-11-04 This book was planned as an aid to students preparing for competitive programming Written in a problem solution format this is exceptionally convenient for analyzing common errors made by the coder in competitive coding sports for reviewing different methods of solving the same problems and for discussing difficult questions of fundamentals of algorithms with focus on dynamic programming Attention can be drawn to various aspects of the problem certain fine points can be made and a more thorough understanding of the fundamentals can be reached The art of formulating and solving problems using dynamic programming can be learned only through active participation by the student Infused with the wisdom of Richard Bellman the father of Dynamic Programming this tiny book distills the inherent concepts and techniques in a problem solution format with focus on to convey the art of formulating the solution of problems in terms of dynamic programming recurrence relations how to define and characterize the optimal value function evaluation of the feasibility and computational magnitude of the solution based on the recurrence relation to show how dynamic programming can be used analytically to establish the structure of the optimal solution or conditions necessarily satisfied by the optimal solution both for their own interest and as means of reducing computation The student must first discover by experience that proper formulation is not quite as trivial as it appears when reading a solution Then by considerable practice with solving problems on his own he will acquire the feel for the subject that ultimately renders proper formulation easy and natural For this reason this book contains a large number 88 of instructional problems in a graded way carefully chosen to allow the student to acquire the art that I seek to convey The student must do these problems on his own Solutions are given next to the problem because the reader needs feedback on the correctness of his procedures in order to learn but any student who reads the solution before seriously attempting the problem does so at this own peril This book provides a functional approach to solving problems using dynamic programming Written in an extremely lively form of problems and solutions including code in modern C and pseudo style this leads to extreme simplification of optimal coding with great emphasis on unconventional and integrated science of dynamic Programming Though aimed primarily at serious programmers it imparts the knowledge of deep internals of underlying concepts and beyond to computer scientists alike
