Blockchain Technology Compliance with the European Union (EU) General Data Protection Regulation (GDPR) Oliver Zeidler,2020-09-04 Essay from the year 2020 in the subject Computer Sciences Internet of Things IOT grade 1 0 Oxford University Faculty of Law language English abstract In this essay I will argue that the GDPR is slowing down technology progress in the EU with respect to the Blockchain technology The blockchain is of particular interest to me as I detected the potential legal issues and impact of blockchain technology within my professional

work I identified several legal ramifications in different fields of law that I believe will raise major problems in the near future. Moreover, it is not currently certain how the United Kingdom will treat international law internally after Brexit as Article 3 of GDPR is limiting the spatial application area to the European Union and processes taking place in this terrain. I will outline these problems here.

Blockchain-based Digital Twins. Requirements and Design Decisions for the Data Storage
Tobias Heinrich, 2023-01-12 Master's Thesis from the year 2022 in the subject Computer Science Miscellaneous University of Hohenheim language English abstract

The following research goal is the development of design decisions for the blockchain-based storage of digital twin data. The digital twin can be deployed in almost every industry and is able to represent any object, being process or organisation. The resulting benefits are versatile and can encompass a higher transparency and efficiency, cost reduction, or the enabling of completely new functions such as the virtual commissioning. Digital twins do even contribute to a sustainable industrial production as they enable a corresponding reduction of the primary energy emissions of up to eight percent. Due to this substantial added value, digital twins pertain to the top ten strategic technology trends and are expected to reach a market size of over 48 billion USD by 2026. The existence of digital twins is strongly dependent on its underlying data, for which reason the data storage is of fundamental importance for the operation of this technology. In the past, the digital twin concept mostly relied upon a traditional storage infrastructure in form of databases or clouds. However, digital twins and its data storage face major challenges, e.g. through a more and more connected world and therefore an increasing number of potential participants and data volume, or as a consequence of growing data security-related risks. Furthermore, potential digital twin use cases entail varying conditions for which reason alternative storage solutions must be assessed. The blockchain technology might constitute a possible alternative to realize the storage of digital twin data. Through the novel and nearly unique characteristics such as immutability, decentralisation, or manipulation safety, blockchains could introduce new opportunities to address digital twin use cases. Those characteristics seem relevant at first sight as the application areas of digital twins become more manifold, especially as the digital twin concept evolves from a descriptive to a rather actionable approach and include more critical data. How the blockchain technology can actually deal with the requirements for the data storage, including the abovementioned challenges, must therefore be evaluated in order to facilitate their interplay and potentially achieve their full potential. Hereby, at first, the data storage in digital twins must be understood comprehensively to assess the suitability of their deployment.

Gender Gap in Blockchain Systems
Amanda Van Annan, 2025-10-14 Master's Thesis from the year 2024 in the subject Computer Science Internet New Technologies grade 1.5 course MBA language English abstract

Blockchain focuses on using digital systems to execute and record online transactions that can only be perceived or considered as the building blocks developed from digital algorithms and secured through cryptography. This technology system is one of the key strategic technology trends used in various organizations or public sectors to record transactions. The problem at hand is the gender gap within the blockchain industry where African American

women are underrepresented and face various challenges in their pursuit of opportunities and advancement. Despite the increasing interest in blockchain technology, the participation of women in the industry remains significantly lower compared to their male counterparts. This gender disparity not only limits the diversity of talent and ideas within the industry but also hinders the industry's overall growth, innovation, and potential for positive social impact. Existing studies on gender gaps in technology fields, while valuable, often provide a limited understanding of the specific dynamics and challenges within the blockchain industry. There is a need for focused research that examines the gender gap in blockchain systems and investigates the unique factors that contribute to women's underrepresentation. This study aims to fill this gap by investigating the gender gap in blockchain systems, focusing on African American women's perspectives and their involvement in blockchain technology. By addressing this research gap, we can gain insights into the barriers African American women face in the industry and identify strategies to foster a more inclusive and equitable blockchain ecosystem.

The general research question is: What are the potential factors that lead to the gender gap in blockchain systems among African American women in the US who are influencers in the blockchain space? The sub-research questions are: How does race influence gender inequality in blockchain technology change among African American women in the US? How do trust and transparency influence the leadership position of African American women in the blockchain system? What are the key strategies or success factors to promote future gendered leadership in blockchain systems?

[The Cryptocurrency Bitcoin And Causal Effects Of Market Volatility](#) Gabriele Pauliuk, 2020-05-12. Academic Paper from the year 2018 in the subject Economics: Monetary theory and policy, grade 9-10. International School of Management Campus Munich course Financial Geography, language English. abstract: This work is about bitcoin and illegal trading as well as fluctuations and the causal effect of it. The recent emergence of new technologies in the financial sector and virtual communities lead to new types of transactions and started questioning the relevance of financial centers around the world. The main reason for the emergence of virtual currencies, cryptocurrencies, is not necessarily incapability or shortcomings of traditional currencies but rather the development of the internet and its networks. Unfortunately, cryptocurrencies raise more controversies on questions such as legal framework, financial risks, or effect on the economy. This is a challenge for the financial sector and the existence of financial centers. In the beginning, it is necessary to define Virtual Currencies. This type of currency can be defined as International Monetary Fund (IMF) in a research: Monetary and Capital Markets, Legal and Strategy and Policy Review. Departments describes digital representations of value issued by private developers and denominated in their own unit of account. This definition clarifies the usage of virtual currencies as it has the functionality to be transacted electronically, stored, accessed if two parties of a transaction confirm an exchange. Virtual currencies emerged because of the creation of a blockchain or so-called distributed ledger system. This system is exceptional because of decentralization principles. The most important detail in a system is the unique ledger of transactions. Bitcoin technology allows to have a consensus between

members of a network and decentralize transactions within a network
