1. receive new observation $x = [x_1 \dots x_d]$ and target y^*
2. **feed forward:** for each unit g_j in each layer $1 \dots L$
compute g_j based on units f_k from previous layer: $g_j = \sigma \left(u_{j0} + \sum_k u_{jk} f_k \right)$
3. get prediction y and error $(y - y^*)$
4. **back-propagate error:** for each unit g_j in each layer $L \dots 1$

(a) compute error on g_j

$$\underbrace{\frac{\partial E}{\partial g_j}}_{\text{should } g_j \text{ be higher or lower?}} = \sum_i \underbrace{\sigma'(h_i) v_{ij}}_{\text{how } h_i \text{ will change as } g_j \text{ changes}} \underbrace{\frac{\partial E}{\partial h_i}}_{\text{was } h_i \text{ too high or too low?}}$$

(b) for each u_{jk} that affects g_j

(i) compute error on u_{jk}

$$\frac{\partial E}{\partial u_{jk}} = \underbrace{\frac{\partial E}{\partial g_j}}_{\text{do we want } g_j \text{ to be higher/lower}} \underbrace{\sigma'(g_j) f_k}_{\text{how } g_j \text{ will change if } u_{jk} \text{ is higher/lower}}$$

(ii) update the weight

$$u_{jk} \leftarrow u_{jk} - \eta \frac{\partial E}{\partial u_{jk}}$$

Neural Networks And Back Propagation Algorithm:

Backpropagation Yves Chauvin, David E. Rumelhart, 2013-02-01 Composed of three sections this book presents the most popular training algorithm for neural networks backpropagation The first section presents the theory and principles behind backpropagation as seen from different perspectives such as statistics machine learning and dynamical systems The second presents a number of network architectures that may be designed to match the general concepts of Parallel Distributed Processing with backpropagation learning Finally the third section shows how these principles can be applied to a number of different fields related to the cognitive sciences including control speech recognition robotics image processing and cognitive psychology The volume is designed to provide both a solid theoretical foundation and a set of examples that show the versatility of the concepts Useful to experts in the field it should also be most helpful to students seeking to understand the basic principles of connectionist learning and to engineers wanting to add neural networks in general and backpropagation in particular to their set of problem solving methods

FUNDAMENTALS OF MACHINE LEARNING TECHNIQUES Mr. Dayakar Babu Kancherla, Ishita Arora, Maher Ali Rusho, Tasriqul Islam, 2024-01-10

Machine learning is a subfield of computing science that evolved both from the knowledge obtained through the process of learning how to classify data based on that understanding and also from the understanding gained through the process of learning the computational based concepts of Artificial Intelligence or AI Machine learning also known as ML is a common abbreviation for the field To put it another way machine learning is the process of training computers to learn on their own via their interactions with data without being explicitly taught to do so This is accomplished through the use of artificial neural networks Both humans and animals may claim to be the first to conceptualize what we now call learning There are a lot of similarities to be discovered between the way that machines learn and the way animals learn In point of fact many of the methods that are now used in machine learning were first created to imitate the foundations of animal and human learning using computer representations This was done to further the field of artificial intelligence The basic scientific concept of habituation for instance outlines the process by which an animal progressively ceases reacting to a stimulus that has been repeatedly shown to the animal If a dog is taught to perform a range of tasks such as rolling over sitting picking up objects etc it is considered to be an outstanding example of animal learning since it is capable of considerable learning if it is trained to do so If a dog is taught to execute a number of tasks such as rolling over sitting picking up items etc it is considered to be an excellent example of animal learning Many people believe that dogs are the best representatives of animal intelligence As opposed to the preceding example of successful learning there aren t many real world applications of machine learning that we can point to as evidence that it s a helpful notion in the current world This is in contrast to the earlier demonstration of successful learning Virtual personal assistants traffic predictions using GPS navigation surveillance of multiple cameras by AI to detect crime or unusual behavior of people social media uses ML for face recognition and news feed personalization search engine result refinement e mail spam filtering where a machine memorize all the previously labeled spam e mails by the user and a lot more applications are just some of the many places where ML is widely used Other applications include a lot more applications By using all of these applications it has become abundantly evident that making use of knowledge and experience that one already has will result in a more efficient learning process The close link that ML

has to computational statistics which also plays a vital role makes the process of making predictions more simpler and more straightforward Everyone is entitled to wonder why does a machine need to learn something and there is no wrong answer to this question There are just a few compelling arguments in favor of the need of machine learning The fact that we just said that the development of learning capabilities in robots may help us better understand how animals and people gain information should not come as a surprise to anybody

FUNDAMENTAL CONCEPTS OF MACHINE LEARNING

Prof. Gaikwad Anil Pandurang, Prof. Krutika Balram Kakpure, Prof. Swayam Shashank Shah, Prof. Kulkarni Satish

Gunderao, 2023-06-06 The term machine learning refers to a variety of computer technologies that make use of previous data in order to either enhance performance or develop more accurate predictions The term was coined by British computer scientist Stuart Russell The collective term for these many modes of instruction is deep learning In the context of this situation the term experience refers to the historical knowledge that has been amassed and is now accessible to the student This knowledge is what is supposed to be referred to as experience The vast majority of the time this information is stored in the form of electronic data that may be investigated when it is necessary to do so This data may be collected in the form of digitized human labeled training sets or it could be received in the form of any other kind of information that is gained by coming into touch with the environment When it comes to determining how accurate the predictions of a learner are the things that count the most are the kind of the object that is being anticipated as well as the quantity of that item that is being forecasted An example of a learning challenge would be to find a way to properly predict the topic of papers that have not been read by looking at a limited number of documents that have been selected at random and tagged with themes This might be accomplished by looking at a small number of documents that have been categorized In this scenario the student is challenged with coming up with a solution to the issue of how to accurately identify the topic of articles that have not yet been read If there are more persons involved in the sample then the task should in principle be simpler to finish However the level of difficulty of the assignment also relies on the quality of the labels that were applied to the papers in the sample This will make the work more or less challenging Because of this the task might either become much simpler or significantly more challenging This is because some of the labels could not be completely correct and it also is depending on the number of subjects that can be accessed The process of machine learning calls for the development of prediction algorithms that are capable of producing outcomes that are both accurate and efficient
