Modern Radar System Analysis David K. Barton, 2007 A software that offers radar and electronic warfare engineers a tool for solving the radar equation for the maximum range at which a radar can achieve target detection under conditions of various interference sources such as thermal noise surface clutter precipitation chaff and jamming *Modern Radar System Analysis* David Knox Barton, 1988 This book presents the basic principles analyses design formulas and characteristics of various fin line configurations You ll find summaries of hundreds of rigorous formulas as well as approximate closed form expressions which can be readily programmed to generate design data for any structure Discover millimeter wave integrated circuits and components realized using the various fin line techniques presented in the text including directional couplers power dividers attenuators detectors modulators and oscillators An Artech House bestseller **Modern Radar System Analysis Software and User's Manual** David K. Barton, William F. Barton, 1990-09-01 **Modern Radar Systems** Hamish Meikle, 2008 This revised and updated edition to the popular Artech House book Modern Radar Systems offers complete and current coverage of the subject including new material on accuracy resolution and convolution and correlation The book features more than 540 illustrations drawn in Maple V that offer a greater understanding of various waveforms and other two and three dimensional functions to help you more accurately analyze radar system performance The effects of pulse shaping on transmitter stability and spectra are discussed a topic which is becoming more and more important in the age of electromagnetic compatibility The book addresses the importance of low attenuation and reflection between the main radio frequency blocks including the use of oversized waveguides for long runs *Radar Systems Principles* Harold R. Raemer, 1996-10-30 In planning a radar system having the proper mathematical modeling of propagation effects clutter and target statistics is essential Radar Systems Principles provides a strong theoretical basis for the myriad of formulas and rules of thumb required for analysis conceptual design and performance evaluation of radar systems Mathematical derivations of

formulas commonly used by radar engineers are presented with detailed discussions of the assumptions behind these expressions and their ranges of validity. These principles are used in a wide range of radar applications. *Radar Systems Principles* makes it easy to understand the steps in calculating various formulas and when and how these formulas are used. A set of problems is provided for each chapter enabling you to check your progress in applying the principles discussed in each section of the text. There are more than 170 figures illustrating key concepts. Numerous references to well known books on radar for coverage of practical design issues and other specialized topics are given. *Radar Systems Principles* is an ideal textbook for advanced undergraduates and first year graduate students and also makes an excellent vehicle for self study by engineers wishing to enhance their understanding of radar principles and their implication in actual systems. *Principles of Modern Radar Missile Seekers* Evgeny Markin, 2022-02-28. This book gives you an in depth look into the critical function of interference shielding for onboard radar of anti aircraft missile systems. Intended for radar engineers and technicians specializing in anti aircraft defense the book reviews today's military and geo political threats helps you understand the functional needs of the various radar and anti missile systems to meet those threats and synthesizes considerations for devising practical and effective protection against interferences that affect the homing heads of anti aircraft guided missiles. Three problematic interferences are presented and discussed in detail: polarization interference, interference to the sidelobe of onboard antennas and interference from two points in space including interference reflected from the earth water surface. The book covers the basic principles of radiolocation including monopulse radars and gives insight into the fundamental functional units of anti aircraft missiles and surface to air missile systems. The book presents guidance methods systems of direction finding problems on firing over the horizon and questions of accuracy and resolution all important for better addressing solutions of interference shielding. You will learn how to estimate the stability of target auto tracking under conditions of cited interferences and better assess existing limitations on firing over the horizon by a long range anti aircraft system as well as hypersonic targets and satellites. This is a unique and valuable resource for engineers and technicians who are involved in the design and development of anti aircraft guided missile systems with special emphasis on interference immunity and protection. It can also be used as a textbook in advanced radar technology coursework and seminars.
