Communication Networks and Computer Systems Javier A. Barria,2006 Communication networks and computer systems research is entering a new phase in which many of the established models and techniques of the last twenty years are being challenged The research community is continuing to free itself from past intellectual constraints so that it may fully exploit the convergence of computing and communications Evaluating the performance of emerging communications and computer systems constitutes a huge challenge Thus current research provides a set of heterogeneous tools and techniques embracing the uncertainties of time and space varying environments when the requests for diverse services are made in real time and with very different quality of service expectations These novel techniques will lead to fast and economic service deployment and effective dynamic resource management and hence to new business strategies and infrastructures that will facilitate the emergence of future services and applications This volume contains contributions and presentations made by leading international researchers at a workshop which was held in April 2004 to honour Professor Erol Gelenbe on the occasion of his inaugural lecture as the Dennis Gabor Chair at Imperial College London

Computer Communication Networks R.L. Grimsdale,F.F. Kuo,1975-02-28 In 1968 the Advanced Research Projects Agency ARPA of the U S Department of Defense began implementation of a computer communication network which permits the interconnection of heterogeneous computers at geographically distributed centres through out the United States This network has come to be known as the ARPANET and has grown from the initial four node configuration in 1969 to almost forty nodes including satellite nodes in Hawaii Norway and London in late 1973 The major goal of ARPANET is to achieve resource sharing among the network users The resources to be shared include not only programs but also unique facilities such as the powerful ILLIAC IV computer and large global weather data bases that are economically feasible when widely shared The ARPANET employs a distributed store and forward packet switching approach that is much better suited for computer communications networks than the more conventional circuit switching approach Reasons favouring packet switching include lower cost higher capacity greater reliability and minimal delay All of these factors are discussed in these Proceedings
