

La chromatographie en phase gazeuse (CPG)

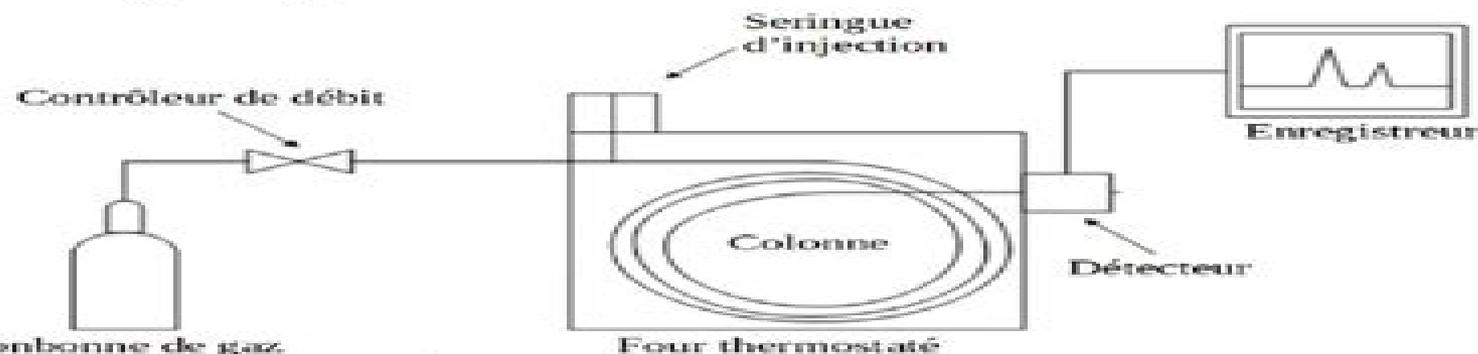

1. Introduction

La chromatographie en phase gazeuse (CPG) (gas chromatography, GC, en anglais) est une technique qui permet de séparer des molécules d'un mélange éventuellement très complexe de nature et de volatilité très diverses. Elle s'applique principalement aux composés gazeux ou susceptibles d'être vaporisés par chauffage sans décomposition. C'est également le seul type de chromatographie qui utilise un gaz comme phase mobile, ce qui nécessite un appareil spécial, appelé communément le chromatographe à gaz. (La phase mobile est un gaz vecteur).

selon la phase stationnaire , il existe deux types de chromatographies en phase gazeuse:

- Chromatographie gaz-solide (CGS) : C'est une chromatographie d'adsorption : la phase stationnaire est un solide poreux, réservé à l'analyse de mélanges de gaz ou de liquides à bas points d'ébullition.
- Chromatographie gaz-liquide (CGL) : C'est une chromatographie de partage : la phase stationnaire est un liquide immobilisé sur un support solide par imprégnation ou par greffage.
