

Basic Assumptions in Describing Function Analysis:

Consider a nonlinear system in the general form of Figure 4. In order to develop the basic version of the describing function method, the system has to satisfy the following four conditions:

1. There is only a single nonlinear component
2. The nonlinear component is time invariant (saturation, backlash, Coulomb friction, etc.)
3. Corresponding to a sinusoidal input $x = \sin(\omega t)$, only the fundamental component $w_1(t)$ in the output $w(t)$ has to be considered. $|G(n\omega)| \gg |G(m\omega)|$ for $n = 2, 3, \dots$
4. The nonlinearity is odd (symmetry about the origin).

Malcolm MacCallum (Jr), ILLINOIS UNIV URBANA., 1965 In this report a generalized approach is used in the development of describing functions for autonomous nonlinear sampled data NLS systems The principles and assumptions of describing function theory are examined and developed so that they are applicable to the nonlinear sampled data problem The direct application of Fourier analysis to the signals involved in the system is made possible by location of the nonlinear element in front of the sampler The basic assumption made is that the error signal entering the nonlinear element is a pure sinusoid
