engineers in the oil industry researchers and graduate students interested in designing and simulating offshore hydrocarbon
production systems It approaches offshore oil production systems from an integrated perspective that combines the modeling
of thermophysical properties of reservoir fluids and their flow as a multiphase mixture in wellbores flow lines and risers The
first part of the book presents an internally consistent method to compute the critical parameters and acentric factor of
Single Carbon Number SCN fractions of petroleum mixtures using state of the art multivariate fitting techniques The
procedure is illustrated and validated using flash and differential liberation data from actual field samples In the second part
of the book mechanistic multiphase flow models are discussed in light of their ability to predict the pressure temperature and
phase holdup of production fluids in wellbores flow lines and risers Multivariate fitting procedures are again applied to
evaluate the sensitivity of the results with respect to closure relationship parameters such as slug body gas holdup wall shear
