Munivara Prasad,2023-08-22 The Internet revolution has completely changed the traditional ways of functioning of essential applications including banking healthcare defense academic and logistics Internet based services replaced these traditional services at a rapid pace over the past two decades Growth in internet dependency of individuals and entities resulted that the internet is the fundamental support for the information world The emergence of new Internet based services such as e governance e procurement and other services are contributing significantly to the global social and economic development With the exponential growth in Internet based services and users worldwide the internet infrastructure and services are facing numerous challenges related to continuous attacks Distributed Denial of Service DDoS is one of the most observed attacks over internet architecture posturing robust challenges to defense mechanisms incorporated in the framework As the DDoS attack information is not made public by companies to avoid deterioration of brand value researchers often face the problem of the limited information available to design effective defensive strategies against DDoS attacks The current section presents the impact of DDoS attack and the inherent vulnerability of the internet architecture Real events of DDoS attack together with their financial impact on companies are included Further the need for designing an efficient DDoS defense strategy is presented in the research work

The internet resources and network systems should be readily accessible for genuine users who aim to use the services at any specific time. Unavailability of internet services and applications at the required instance is one of the major challenges restricting the spread of Internet based services. The unavailability can result to either intentional causes or accidental causes. The basic internet framework is designed to handle accidental failures but is not efficient against intentional purposes such as intrusion, malware, hacking etc. The Denial of Service (DoS) attack is categorized under intentional failures observed on the internet which are caused by malware programmers or intruders. These attackers deny or compromise the availability of internet resources to genuine or authorized users.

Target Loss and Entropy Awareness Xiang Ran, 2007 Distributed Denial of Service-Defense Attack Tradeoff Analysis (DDOS-DATA), 2004. The project uses modeling and simulation to analyze performance of mitigation technologies to combat Distributed Denial of Service Attacks. The system also determines how an attacker can react to mitigation technologies and how mitigation technologies can be layered to reduce attacker effectiveness.

Mitigation and Traceback Countermeasures for DDoS [i.e. DoS] Attacks Basheer Nayef Al-Duwairi, 2005. Denial of service (DoS) attacks impose an imminent threat to the availability of Internet services. The alarming increase of such attacks coupled with the emergence of sophisticated DoS attack techniques call for efficient defense mechanisms to counter these attacks. Although there has been ongoing research in this area focusing on DoS prevention, mitigation, and traceback, the existing countermeasures lack in several qualitative and quantitative metrics. In this context, this dissertation makes two key contributions in the design and analysis of efficient, scalable schemes for DoS mitigation and traceback.

First, efficient perimeter mitigation schemes based on novel concepts such as protocol determinism and victim assistance are proposed. The proposed schemes enable ISP edge routers to perform timely mitigation of both end-host and network exhaustion attacks. The proposed mitigation schemes have been evaluated through analytical studies for classical and advanced attacks, quantifying security metrics such as false positive and false negative rates and performance metrics such as effective attack rate and connection establishment latency increase. Our analysis shows that the proposed schemes offer very low false positive and false negative rates and reduce attacker's effective attack rate significantly with an acceptable increase in connection establishment latency.

Second, hybrid IP traceback schemes that integrate the concepts of packet marking and packet logging in a novel manner are proposed. The goal is to achieve a drastic reduction in the number of attack packets required to conduct the traceback process. The proposed traceback schemes have been evaluated through a combination of analytical and simulation studies, quantifying performance metrics such as number of attack packets, storage overhead, and attack localization distance. Our studies show that the proposed traceback schemes are superior in comparison to the well-known PPM scheme.

This dissertation opens up several directions for future research, which includes:

1. designing efficient mitigation schemes in the context of inter-domain network
2. designing efficient mitigation schemes that employ traceback
3. designing a comprehensive DoS defense mechanism that integrates DoS prevention, mitigation, and traceback in an efficient

manner
