We consider a self-consistent system of Bianchi type-I (BI) gravitational field and a binary mixture of perfect fluid and dark energy. The perfect fluid is taken to be the one obeying the usual equation of state, i.e.,  $p = \zeta \epsilon$ , with  $\zeta \in [0, 1]$  whereas, the dark energy density is considered to be either the quintessence or the Chaplygin gas. Exact solutions to the corresponding Einstein equations are obtained.

## I. INTRODUCTION

The description of the different phases of the Universe concerning the time evolution of its acceleration field is among the main objectives of the cosmological models. There is mounting evidence that the Universe at present is dominated by the so-called dark energy. Although the nature of the dark energy (DE) is currently unknown, it is felt that DE is non-baryonic in origin [1]. It is also believed that the dark energy has large negative pressure that leads to accelerated expansion of the Universe.

In view of its importance in explaining the observational cosmology many authors have considered cosmological models with dark energy. The simplest example of dark energy is a cosmological constant, introduced by Einstein in 1917 [2]. The discovery that the expansion of the Universe is accelerating [3] has promoted the search for new types of matter that can behave like a cosmological constant [4, 5] by combining positive energy density and negative pressure. This type of matter is often called *quintessence*. Zlatev *et al.* [6] showed that "tracker field", a form of quintessence, may explain the coincidence, adding new motivation for the quintessence scenario.

An alternative model for the dark energy density was used by Kamenshchik *et al.* [7], where the authors suggested the use of some perfect fluid but obeying "exotic" equation of state. This type of matter is known as *Chaplygin gas*. The fate of density perturbations in a Universe dominated by the Chaplygin gas, which exhibit negative pressure was studied by Fabris *et al.* [8]. Model with Chaplygin gas was also studied in the Refs. [9, 10]. In a recent paper Kremer [11] has modelled the Universe as a binary mixture whose constituents are described by a van der Waals fluid and by a dark energy density. In doing so the authors considered mainly a spatially flat, homogeneous and isotropic Universe described by a Friedmann-Robertson-Walker (FRW) metric.

The theoretical arguments and recent experimental data, which support the existence of an anisotropic phase that approaches an isotropic one, lead to consider the models of Universe with

**COSMOLOGY** Dr. Amit Prakash, 2019-11-07 We live in this universe Hence it is essential to understand the origin evolution and ultimate fate of the universe This can be effectively done by constructing mathematical models of the universe using Einstein's theory of gravitation and other modified theories of gravitation The models thus obtained can be compared with the present day observations to decide about the shape physics and origin of the universe With this motivation we have taken up the investigations in this book entitled **STUDIES ON GRAVITATIONAL FIELD EQUATIONS AND IMPORTANT RESULTS OF RELATIVISTIC COSMOLOGY** This book comprises of six chapters and deals with some spatially homogeneous isotropic and anisotropic cosmological models of the universe in some modified theories of gravitation *Literature 1987, Part 1* S.
