Abstract:

Now-a-days, robotic systems have less manual operations, flexibility, dependability and accurate. Detect the bomb by transfer the robot to the particular place. A person can work the system from personal computer during wireless RF control. Aims at designing and execute the bomb ,fire and obstacle exposure. The IR sensor is a pair sensors has a beneficiary and a transmitter sensor. In the current scenario of war situations, unmanned systems plays very main role to minimize human losses. This robot is fitted with motors. A micro controller is used to manage all operations. According to the motor operations the robot will operate as individual in program. Whenever any fire is detected, the Buzzer will ON.

Keywords — Bomb Detection, IR sensor, Robotics, Web server.

I. Introduction:

A simulation game is collected of three foremost elements: scenery, one or more characters and some rules. The characters can be real or fantastic. A micro controller is an incorporated circuit composed of a CPU, various peripheral devices, and normally memory, all in niches. Using one chip that contains all the needed functions in place of a microprocessor and many peripheral chips has compact the size and the power conservation of control oriented applications. For avoiding this types of problem in the nuclear command plant. The additional facial appearance of this project are that the robot is illegal by web server. A microcontroller not only accepts the data as inputs but also manipulates it, interface the data with various devices, controls the data and thus finally gives the result. A remotely restricted robot is able to enhance the safety of the artificers and, at the same time, to execute successfully the task. Since water cannons and micro charges, typical tools of robots that operate outdoor, cannot be used inside an airplane, any other method that allows to identify potential explosive devices is exceptionally valuable: cameras, X rays, etc. The robots existing on the market can be confidential depending on "what" they are able to handle (mass and size of the object) and "where" they should work (indoor,

outdoor, structured environment). The mass and the size of the object are essential for the correct design of the arm and of the grasping device.

II. ARCHITECTURE AT ROBOTIC SIDE

The projected design is illustrated in this part. It also gives the complete information about the interfaced devices to execute this project. It consists of analog to digital converters, multiple axes, potentiometers, metal detector and cell phone jammer. location and direction of hand is obtained by two main parts; data glove and antenna arm cover. Data glove consists of 5 potentiometer as shown in Figure3. Bend of the five fingers can be measured by potentiometer.

Bomb detector is presently act as metal detector which detected any metal in the essential areas. Because the bombs made with metals. The bomb detector is attached in the topside with an antenna. Robot movements are restricted remotely.

III. Basic System Model:

Radio frequency (RF) is a rate of wavering in the variety of about 3 kHz to 300 GHz, which corresponds to the frequency of radio waves, and the alternating currents which bring radio signals. RF regularly refers to electrical rather than mechanical oscillations; however, reflex RF
