Modeling Fractional Outcomes with GLSTM

Wenbin Liu, PhD, (Trent University)

March 20, 2020

Abstract

The generalized GLS (GLS) theory about fractional regression with Gaussian distributional assumption has been the first choice to model fractional outcomes in many business problems. However, it is controversially found as having Gaussian distribution for a response variable in the [0, 1] range. In this paper, several existing techniques for fractional outcomes with their implementations in R/RN proved to be flawed through a data analysis exercise in modeling fractional average value at riskness. The purpose of this paper is to provide a relatively comprehensive survey of how to model fractional outcomes in the RAN and (non)linear and (non)normal distributions.

Keywords:

Fractional outcomes, Total model, GLS (Gaussian total Squared) regression, Fractional logit model, Beta regression, Dirichlet regression, Poisson models.

1. Introduction

In the financial services industry, we often observed business outcomes in model fractional outcomes in the range of [0, 1]. For instance, at the end of an credit line, LAR (Loan Loss Ratio (Default)) measures the proportion of losses not recovered from a default borrower during the collection process, which is observed in the closed interval [0, 1]. Another example is the average fractional coverage ratio (apportioned) for the long term debt as a proportion of the committed to fund the long-term debt and the equity.

Although several theories in statistical models for fractional outcomes have emerged during the past years, there is still no general agreement on either the distributional assumption or the modeling practice. (a) Incorporating the generalized linear model of the linear range GLS regression with Gaussian distributional assumption has remained the most popular method to model fractional outcomes due to the simplicity. However, the agreement with GLS regression suffers from a couple of important flaws: First and the most important of all, fractional outcomes in the [0, 1] interval are not defined on the whole real line and therefore shouldn't be considered normally distributed. Moreover, a statistical counterexample of fractional outcomes is that the observed is not independent of the mean. (b) Instead, the empirical evidence on the most appropriate modeling practice of [0, 1], which is modeling that in form of (non)normality.
