

The Ultimate Guide to 3D Printing Thermosets for Manufacturing and Production

This paper examines the difference between traditional SLA, DLP and JDP for additive manufacturing in a large build envelope where high accuracy, repeatability, reliability and throughput are required.

After more than three decades of research and development, 3D printing is ready for prime time in manufacturing — production of high-value parts and mass customized products, in addition to prototypes, injection molding tooling, end-of-arm tooling and assembly jigs and fixtures.

In fact, a variety of manufacturers have been using 3D printing, also known as additive manufacturing, this way for years now, with more adopting the technology every day. In addition to manufacturers of all sizes, the range of production users also includes laboratories, hospitals and Hollywood studios.

Did you know, for example, that the global hearing aid industry has been mass producing custom hearing aids with 3D printers for more than a decade? In recent years, dental laboratories have also been mass producing dental and orthodontic models, which require high XY accuracy and a smooth surface finish. This has paved the way for the mass production of clear thermoformed aligners for teeth straightening, in addition to other dental products. And in 2016, General Electric began mass production of metal fuel nozzle injectors for its LEAP jet engine using 3D additive manufacturing machines — validating the idea that 3D printing isn't just for prototypes anymore.

This large part was 3D printed in EnvisionTEC's ABS Hi-Impact material on the Side JDP machine, which has a build envelope of 457 x 457 x 457 mm (18 x 18 x 18 in.)
