

## BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

### Application / Function

Dynamic gaskets are generally used to seal and support the sliding, the rotation of the shafts in a bearing to allow movement. These consist of 2 gaskets which distribute axial forces in a gasket with an application on all shafts and shaft components used to rotate the shaft. A gasket is used to maintain the pressure in a shaft or a bearing throughout the life cycle application. The gasket compresses the shaft components between the mating surfaces of the shaft. This is done by creating a radial force on the shaft. The gasket is used to seal the shaft between the mating surfaces. If the gasket is not installed correctly for axial and rotational through the life of the application then it will be replaced by a gasket.

In order to determine the application requirements will require the gasket design to optimize the gasket to meet the shaft seal. Every gasket application is unique but there are common elements that must be addressed to optimize the performance of shaft seal gasket in an system or the application.
