

We have, for example,

**Theorem 4.1.** Let the sets  $B, C$  belong to some PRC class  $\mathcal{E}$ . Then so do the sets  $B \cup C, B \cap C, \bar{B}$ .

*Proof.* This is an immediate consequence of Theorem 5.1, Chapter 3. ■

As long as the Gödel numbering functions  $[x_1, \dots, x_n]$  and  $(x)_i$  are available, we can restrict our attention to subsets of  $N$ . We have, for example,

**Theorem 4.2.** Let  $\mathcal{E}$  be a PRC class, and let  $B$  be a subset of  $N^m$ ,  $m \geq 1$ . Then  $B$  belongs to  $\mathcal{E}$  if and only if

$$B' = \{[x_1, \dots, x_m] \in N \mid (x_1, \dots, x_m) \in B\}$$

belongs to  $\mathcal{E}$ .

*Proof.* If  $P_B(x_1, \dots, x_m)$  is the characteristic function of  $B$ , then

$$P_{B'}(x) \Leftrightarrow P_B((x)_1, \dots, (x)_m) \ \& \ \text{Lt}(x) = m$$

is the characteristic function of  $B'$ , and  $P_{B'}$  clearly belongs to  $\mathcal{E}$  if  $P_B$  belongs to  $\mathcal{E}$ . On the other hand, if  $P_{B'}(x)$  is the characteristic function of  $B'$ , then

$$P_B(x_1, \dots, x_m) \Leftrightarrow P_{B'}([x_1, \dots, x_m])$$

is the characteristic function of  $B$ , and  $P_B$  clearly belongs to  $\mathcal{E}$  if  $P_{B'}$  belongs to  $\mathcal{E}$ . ■

It immediately follows, for example, that  $\{[x, y] \in N \mid \text{HALT}(x, y)\}$  is not a computable set.

**Definition.** The set  $B \subseteq N$  is called *recursively enumerable* if there is a partially computable function  $g(x)$  such that

$$B = \{x \in N \mid g(x) \downarrow\}. \quad (4.1)$$

The term *recursively enumerable* is usually abbreviated *r.e.* A set is recursively enumerable just when it is the domain of a partially computable function. If  $\mathcal{P}$  is a program that computes the function  $g$  in (4.1), then  $B$  is simply the set of all inputs to  $\mathcal{P}$  for which  $\mathcal{P}$  eventually halts. If we think of  $\mathcal{P}$  as providing an algorithm for testing for membership in  $B$ , we see that for numbers that do belong to  $B$ , the algorithm will provide a

Reverse Mathematics Damir D. Dzhafarov, Carl Mummert, 2022-07-25  
Reverse mathematics studies the complexity of proving mathematical theorems and solving mathematical problems Typical questions include Can we prove this result without first proving that one Can a computer solve this problem A highly active part of mathematical logic and computability theory the subject offers beautiful results as well as significant foundational insights This text provides a modern treatment of reverse mathematics that combines computability theoretic reductions and proofs in formal arithmetic to measure the complexity of theorems and problems from all areas of mathematics It includes detailed introductions to techniques from computable mathematics Weihrauch style analysis and other parts of computability that have become integral to research in the field Topics and features Provides a complete introduction to reverse mathematics including necessary background from computability theory second order arithmetic forcing induction and model construction Offers a comprehensive treatment of the reverse mathematics of combinatorics including Ramsey s theorem

Hindman's theorem and many other results Provides central results and methods from the past two decades appearing in book form for the first time and including preservation techniques and applications of probabilistic arguments Includes a large number of exercises of varying levels of difficulty supplementing each chapter The text will be accessible to students with a standard first year course in mathematical logic It will also be a useful reference for researchers in reverse mathematics computability theory proof theory and related areas Damir D Dzhafarov is an Associate Professor of Mathematics at the University of Connecticut CT USA Carl Mummert is a Professor of Computer and Information Technology at Marshall University WV USA

**Computability, Complexity, Logic** E. Börger, 1989-07-01 The theme of this book is formed by a pair of concepts the concept of formal language as carrier of the precise expression of meaning facts and problems and the concept of algorithm or calculus i.e. a formally operating procedure for the solution of precisely described questions and problems The book is a unified introduction to the modern theory of these concepts to the way in which they developed first in mathematical logic and computability theory and later in automata theory and to the theory of formal languages and complexity theory Apart from considering the fundamental themes and classical aspects of these areas the subject matter has been selected to give priority throughout to the new aspects of traditional questions results and methods which have developed from the needs or knowledge of computer science and particularly of complexity theory It is both a textbook for introductory courses in the above mentioned disciplines as well as a monograph in which further results of new research are systematically presented and where an attempt is made to make explicit the connections and analogies between a variety of concepts and constructions
