

True dependencies

S4 and S3 through A[i]

S2 and S1 through T[i]

- c. There is an anti-dependence between iteration i and $i+1$ for array B. This can be avoided by renaming the B array in S2.
- 4.15 a. Branch divergence: causes SIMD lanes to be masked when threads follow different control paths
- b. Covering memory latency: a sufficient number of active threads can hide memory latency and increase instruction issue rate
- c. Coalesced off-chip memory references: memory accesses should be organized consecutively within SIMD thread groups
- d. Use of on-chip memory: memory references with locality should take advantage of on-chip memory, references to on-chip memory within a SIMD thread group should be organized to avoid bank conflicts
- 4.16 This GPU has a peak throughput of $1.5 \times 16 \times 16 = 384$ GFLOPS/s of single-precision throughput. However, assuming each single precision operation requires four-byte two operands and outputs one four-byte result, sustaining this throughput (assuming no temporal locality) would require $12 \text{ bytes/FLOP} \times 384 \text{ GFLOPs/s} = 4.6 \text{ TB/s}$ of memory bandwidth. As such, this throughput is not sustainable, but can still be achieved in short bursts when using on-chip memory.
