ABSTRACT

In current scenario, Internet becomes a handy tool to everyone and everyone wants lot things in a very compact form so that less amount of data can be stored or captured in a very small space. As Internet is act as medium of transportation of documents (such as multimedia documents). In this paper, a compression technique is being representated to compress the on form of multimedia document such as image using MatLab. Since, image contains a lot of information in dot form and required a huge space on hard disk. The Image compression technique used discrete cosine transform to deal with the real value during the compression of an image. Using DCT in compression leads to easy calculation of image data in frequency domain.

Keywords: Image compression, JPEG, DCT.

I. INTRODUCTION

Video and image contains a lot of information and consumes huge storage space. Generally internet applications have less or very limited space. To overcome the space requirement image compression is must. This paper introduces the basic concept of data compression using Matlab. Which could be applied to modern image and video compression techniques. Basically, compression is done to reduce the data similarity. Discrete Cosine Transform is frequency domain technique. By applying DCT, the data in time (spatial) domain can be transformed into frequency domain.

In this paper an image compression algorithms are being used in Matlab. The necessary bandwidth is required to digitally represent the data in the form of signals. There are many existing applications in video and audio that made it inexpensive because its ability to deal with compressed signals. Compression technology can result in reduced transmission time. In this regard there is less data to be transmitted and decrease the storage requirements, again because there is less data.

There are two types of compression as follows:

1. Lossy compression: This is the technique in which higher compression ratios is achieved. Luckily, the majority of video and image processing applications do not require higher compression ratios. In these applications, lossy compression schemes can be used, achieving higher compression ratios.

2. Lossless compression: In many fields like medical systems, image losses can translate into costly medical mistakes; therefore lossless compression methods are used.

DCT Compression: DCT is a lossy compression scheme in which a MxN image block is transformed from the spatial domain to the Discrete Cosine Transform domain. DCT decomposes the signal into spatial frequencies components called DCT coefficients. The lower frequency DCT coefficients appear toward the upper left-hand corner of the DCT matrix and the higher frequency coefficients are in the lower right-hand corner of the DCT matrix. The Human Visual System (HVS) is tolerant to errors in high frequency coefficients. HVS is not tolerant to lower frequency coefficients. So that the higher frequency components can be changed or quantized. This is done by the quantization technique.

   Hardware Implementation of a JPEG-LS Codec Michael Piorun,2001 The primary goal of this thesis is to implement a hardware version of the JPEG LS or JPEGLossless image compression algorithm in VHDL The JPEG LS algorithm is currently the designated standard for lossless compression of grayscale and color images by the JPEG committee Although lossy image compression is widely used when dealing with grayscale images there are some applications that require lossless image compression so that the original image may be recovered This is often the case for historical and legal document image archives medical and satellite imagery and biometric images The JPEG LS algorithm is much less complex than other current lossless image compression algorithms and offers similar or better compression gains Near lossless compression offers higher compression gains by using a pixel tolerance specified by the user The algorithm uses a predictive technique for compression and the resulting prediction error is encoded not the pixel value itself This prediction error is encoded with Golomb Rice coding which is optimal for a geometric distribution such as prediction error The predictor enters a special run length mode to encode pixels with identical values in lossless mode or nearly identical values within a known value in near lossless mode which maximizes compression further In this thesis the JPEG LS algorithm is implemented in C VHDL and further synthesized using the Synopsys synthesis tool suite Pictorial document medical remote sensing and biometric images are used for testing the project against another standard compliant software implementation The compression ratio for lossless compression is approximately 2 and is greater for near lossless compression The end result is a Synopsys schematic that represents a JPEG LS codec which is capable of lossless and near lossless encoding and decoding Performance characteristics such as chip area speed and power consumption are extracted from the synthesis tool These are approximately 375 000 gates a 15 ns clock cycle and 59 mW respectively A hardware implementation of this algorithm on an FPGA or ASIC would give a digital camera or scanner an edge in the marketplace Abstract   **Telemedicine: The Computer Transformation of Healthcare** Tanupriya Choudhury,Avita Katal,Jung-Sup Um,Ajay Rana,Marwan Al-Akaidi,2022-08-24 This book provides an overview of the innovative concepts methodologies and frameworks that will increase the feasibility of the existing telemedicine system With the arrival of advanced technologies telehealth has become a new subject requiring a different understanding of IT devices and of their use to fulfill health needs Different topics are
