An Introduction to Distributed Algorithms Valmir C. Barbosa, 1996 An Introduction to Distributed Algorithms takes up some of the main concepts and algorithms ranging from basic to advanced techniques and applications that underlie the programming of distributed memory systems such as computer networks networks of work stations and multiprocessors Written from the broad perspective of distributed memory systems in general it includes topics such as algorithms for maximum flow programme debugging and simulation that do not appear in more orthodox texts on distributed algorithms

Introduction to Distributed Algorithms Valmir C. Barbosa, 2003 *Introduction to Reliable and Secure Distributed Programming* Christian Cachin, Rachid Guerraoui, Luís Rodrigues, 2011-02-11 In modern computing a program is usually distributed among several processes The fundamental challenge when developing reliable and secure distributed programs is to support the cooperation of processes required to execute a common task even when some of these processes fail Failures may range from crashes to adversarial attacks by malicious processes Cachin Guerraoui and Rodrigues present an introductory description of fundamental distributed programming abstractions together with algorithms to implement them in distributed systems where processes are subject to crashes and malicious attacks The authors follow an incremental approach by first introducing basic abstractions in simple distributed environments before moving to more sophisticated abstractions and more challenging environments Each core chapter is devoted to one topic covering reliable broadcast shared memory consensus and extensions of consensus For every topic many exercises and their solutions enhance the understanding This book represents the second edition of Introduction to Reliable Distributed Programming Its scope has been extended to include security against malicious actions by non cooperating processes This important domain has become widely known under the name Byzantine fault tolerance

Introduction to Distributed Self-Stabilizing Algorithms Karine Altisen, Stéphane Devismes, Swan Dubois, Franck Petit, 2019-04-15 This book aims at being a comprehensive and pedagogical introduction to the concept of self stabilization introduced by Edsger Wybe Dijkstra in 1973 Self stabilization characterizes the ability of a distributed algorithm to converge within finite time to a configuration from which its behavior is correct i e satisfies a given specification regardless the arbitrary initial configuration of the system This arbitrary initial configuration may be the result of the occurrence of a finite number of transient faults Hence self stabilization is actually considered as a versatile non masking fault tolerance approach since it recovers from the effect of any finite number of such faults in a unified manner Another major interest of such an automatic recovery method comes from the difficulty of resetting malfunctioning devices in a large scale and so geographically spread distributed system the Internet Pair to Pair networks and Delay Tolerant Networks are examples of such distributed systems Furthermore self stabilization is usually recognized as a lightweight property to achieve fault tolerance as compared to other classical fault tolerance approaches Indeed the overhead both in terms of time and space of state of the art self stabilizing algorithms is commonly small This makes self stabilization very attractive for distributed systems equipped of processes with low computational and memory capabilities such as wireless sensor networks After more than 40 years of existence self stabilization is now sufficiently established as an important field of research in

theoretical distributed computing to justify its teaching in advanced research oriented graduate courses This book is an initiation course which consists of the formal definition of self stabilization and its related concepts followed by a deep review and study of classical simple algorithms commonly used proof schemes and design patterns as well as premium results issued from the self stabilizing community As often happens in the self stabilizing area in this book we focus on the proof of correctness and the analytical complexity of the studied distributed self stabilizing algorithms Finally we underline that most of the algorithms studied in this book are actually dedicated to the high level atomic state model which is the most commonly used computational model in the self stabilizing area However in the last chapter we present general techniques to achieve self stabilization in the low level message passing model as well as example algorithms

Distributed Algorithms Fourré Sigs, 2019-01-31 AN ELABORATE YET BEGINNER FRIENDLY GUIDE TO DISTRIBUTED ALGORITHMS Distributed Algorithms a non trivial and highly evolving field of active research is often presented in most publications using a heavy accompaniment of mathematical techniques and notations Aimed squarely at beginners as well as experienced practitioners this book attempts to demystify and explicate the subject of distributed algorithms using a highly expansive and verbose style of treatment Covering scores of landmark algorithms in the field of distributed computing the approach is to present and analyse each topic using a minimum of mathematical exposition reverting instead to a fluid style of description in plain English A mathematical presentation is avoided altogether whenever such a move does not reduce the quality of the analysis at hand Elsewhere the effort always is to talk and guide the reader through the relevant math without resorting to a series of equations To backup such a style of treatment each topic is accompanied by a multitude of examples flowcharts and diagrams The book is divided into three parts the first part deals with fundamentals the second and largest of the three is all about algorithms specific to message passing networks while the last one focuses on shared memory algorithms The beginning of the book dedicates a few chapters to the basics including a quick orientation on the underlying platform i e distributed systems their characteristics advantages challenges and so on Some of the earlier chapters also address basic algorithms and techniques relevant to distributed computing environments before moving on to progressively complex algorithms and results en route to the later chapters in the second part which deal with widely used industrial strength protocols such as Paxos and Raft The third part of the book does assume a basic orientation towards computer programming and presents numerous shared memory algorithms where each one is accompanied by a detailed description analysis pseudo code and in some cases code C or C Whenever actual code is used the syntax is kept as basic as possible incorporating only elementary features of the language so that newbie programmers can follow the presentation smoothly Lastly the target audience of the book is wide enough to cover beginners such as students or graduates joining the industry experienced professionals wishing to migrate from monolithic frameworks to distributed ones as well as readers with years of experience on the subject of distributed computing The style of presentation is selected with the first two classes of readers in mind

those who wish to quickly ramp up on the subject of distributed algorithms for professional reasons or personal ones While staying true to the stated aim the book does not shy away from dealing with complex topics A concise list of content information follows Introduction to distributed systems Properties of distributed data stores and Brewer's theorem Building blocks unicast broadcast algorithms in cubes Leader election algorithms for ring generic networks Consensus algorithms synchronous asynchronous variants for message passing and shared memory systems Distributed commits Paxos Raft Graph algorithms Routing algorithms Time and order Mutual exclusion for message passing networks Debug algorithms snapshot deadlock termination detection Shared memory practical problems mutual exclusion consensus resource allocation About the author Fourr Sigs is an industry veteran with over 25 years of experience in systems programming networking and highly scalable and secure distributed service architectures

Distributed Algorithms for Message-Passing Systems Michel Raynal, 2013-06-29 Distributed computing is at the heart of many applications It arises as soon as one has to solve a problem in terms of entities such as processes peers processors nodes or agents that individually have only a partial knowledge of the many input parameters associated with the problem In particular each entity cooperating towards the common goal cannot have an instantaneous knowledge of the current state of the other entities Whereas parallel computing is mainly concerned with efficiency and real time computing is mainly concerned with on time computing distributed computing is mainly concerned with mastering uncertainty created by issues such as the multiplicity of control flows asynchronous communication unstable behaviors mobility and dynamicity While some distributed algorithms consist of a few lines only their behavior can be difficult to understand and their properties hard to state and prove The aim of this book is to present in a comprehensive way the basic notions concepts and algorithms of distributed computing when the distributed entities cooperate by sending and receiving messages on top of an asynchronous network The book is composed of seventeen chapters structured into six parts distributed graph algorithms in particular what makes them different from sequential or parallel algorithms logical time and global states the core of the book mutual exclusion and resource allocation high level communication abstractions distributed detection of properties and distributed shared memory The author establishes clear objectives per chapter and the content is supported throughout with illustrative examples summaries exercises and annotated bibliographies This book constitutes an introduction to distributed computing and is suitable for advanced undergraduate students or graduate students in computer science and computer engineering graduate students in mathematics interested in distributed computing and practitioners and engineers involved in the design and implementation of distributed applications The reader should have a basic knowledge of algorithms and operating systems
