Systems of Linear Equations and Matrices

Exercise Set 1.1

In Section 1.1 of the text, Gaussian Elimination is used to solve a linear system. This procedure utilizes three operations that when applied to a linear system result in a new system that is equivalent to the original. Equivalent means that the linear systems have the same solutions. The three operations are:

- Interchange two equations.
- Multiply any equation by a nonzero constant.
- Add a multiple of one equation to another.

When used judiciously these three operations allow us to reduce a linear system to a triangular linear system, which can be solved. A linear system is consistent if there is at least one solution and is inconsistent if there are no solutions. Every linear system has either a unique solution, infinitely many solutions or no solutions. For example, the triangular linear systems

$$\begin{cases} x_1 - x_2 + x_3 = 2 \\ x_2 - 2x_3 = -1 \\ x_3 = 2 \end{cases}, \quad \begin{cases} x_1 - 2x_2 + x_3 = 2 \\ -x_2 + 2x_3 = -3 \\ x_3 = 2 \end{cases}, \quad \begin{cases} 2x_1 + x_2 = 1 \\ x_2 - x_3 = 2 \\ 0 = 4 \end{cases}$$

have a unique solution, infinitely many solutions, and no solutions, respectively. In the second linear system, the variable x_3 is a free variable, and once assigned any real number the values of x_1 and x_2 are determined. In this way the linear system has infinitely many solutions. If a linear system has the same form as the second system, but also has the additional equation $0 = 0$, then the linear system will still have free variables. The third system is inconsistent since the last equation $0 = 4$ is impossible. In some cases, the conditions on the right hand side of a linear system are not specified. Consider for example, the linear system

$$\begin{cases} -x_1 - x_2 = a \\ 2x_1 + 2x_2 + x_3 = b \\ 2x_3 = c \end{cases} \text{ which is equivalent to } \begin{cases} -x_1 - x_2 = a \\ x_3 = b + 2a \\ 0 = c - 2b - 4a \end{cases}$$

This linear system is consistent only for values a, b and c such that $c - 2b - 4a = 0$.

Solutions to Exercises

1. Applying the given operations we obtain the equivalent triangular system

$$\begin{cases} x_1 - x_2 - 2x_3 = 3 \\ -x_1 + 2x_2 + 3x_3 = 1 \\ 2x_1 - 2x_2 - 2x_3 = -2 \end{cases} \xrightarrow{E_1 + E_2 \rightarrow E_2} \begin{cases} x_1 - x_2 - 2x_3 = 3 \\ x_2 + x_3 = 4 \\ 2x_1 - 2x_2 - 2x_3 = -2 \end{cases} \xrightarrow{(-2)E_1 + E_3 \rightarrow E_3}$$

Algebra Via Module Theory Dr. Vijay Saini, Module Theory is a branch of abstract algebra that generalizes vector spaces by allowing scalars to come from a ring instead of a field making it a powerful framework to study algebraic structures called modules It extends concepts from linear algebra to a broader context exploring submodules homomorphisms and exact sequences and plays a crucial role in fields like representation theory homological algebra and algebraic geometry This theory provides deep insights into the structure of rings and modules making it a fundamental topic in advanced mathematics and abstract algebra studies Module Theory is a generalization of vector space theory where scalars come from a ring instead of a field A module over a ring is an algebraic structure where ring elements act on abelian groups similarly to how scalars act on vectors Extends and deepens concepts from linear algebra allowing for richer structures and applications Central to modern algebra especially in homological algebra representation theory and algebraic geometry Includes topics like submodules quotient modules homomorphisms exact sequences and tensor products Used to study structures of rings via modules including projective injective and free modules
