S. Coast And Geodetic Survey, 2013-09 This historic book may have numerous typos and missing text Purchasers can usually download a free scanned copy of the original book without typos from the publisher Not indexed Not illustrated 1916 edition Excerpt standard datum for geodetic operations in Canada and Mexico it became a matter of international importance and consequently its designation was changed by the Survey in 1913 to that of the North American datum Plans are now under way for carrying the primary triangulation of the United States and Canada to the Yukon and the prediction is here made that eventually the 50 miles which separate Alaska from Siberia will be spanned and a junction be effected with the great systems of Asia Europe and Africa Then with the extension from Mexico through Central and South America the data will be available for a world datum and the final word will llave been said in the geodetic work of the earth BASE LINE MEASUREMENTS Closely related to and forming an integral part of the triangulation executed by the Coast and Geodetic Survey is the measurement of the base lines for controlling the lengths in triangulation In this work the Survey has furnished much of interest and of value to the geodesist Ever has it kept keenly before it the

necessity for refined measurements and many valuable devices to accomplish this desired result have been added by members of the force BASE BARS The Duplex bars invented by Assistant William Eimbeck and constructed by E G Fischer are probably the best form of base bars ever devised and gave a very high degree of precision but they were soon replaced by the tape as a form of base apparatus The only bar used in the United States and probably in the world which gives entire satisfaction so far as accuracy is concerned is the invar bar designed by President R S Woodward of the Carnegie Institution when an assistant in the Survey Owing to the great cost per kilometer

found to be 60% degrees and again let it be measured in two parts one being found to be 40 degrees and the other 20 degrees The proper adjusted value of the angle is not as might at first be supposed the mean of 60% and 60 which is 60.1 degrees but as will be seen in the next chapter it is 60% degrees a result which requires the correction of each observation by the same amount 83 The method of computing probable errors by formula 20 is that considered the best by all writers Nevertheless on account of the labor of forming the squares of the residuals a simpler and less accurate formula is often employed in which only the residuals themselves are

Geodesy Wolfgang Torge,2011-05-12 The third edition of this well known textbook first published in 1980 has been completely revised in order to adequately reflect the drastic changes which occurred in the field of geodesy in the last twenty years Reference systems are now well established by space techniques which dominate positioning and gravity field determination Terrestrial techniques still play an important role at local and regional applications whereby remarkable progress has been made with respect to automatic data acquisition Evaluation methods are now three dimensional in principle and have to take the gravity field into account Geodetic control networks follow these developments with far reaching consequences for geodetic practice Finally the increased accuracy of geodetic products and high data rates have significantly increased the contributions of geodesy to geodynamics research thus strengthening the role of geodesy within the geosciences The present state of geodesy is illustrated by recent examples of instruments and results An extensive reference list supports further studies
