plate interaction These results show that if an armor plate is set in relative transverse motion with respect to an incidental projectile it acquires a greater protection capability than the corresponding stationary plate This has implications for armor applications for live fire testing and for vulnerability and lethality analyses

Validation of the U.S. Army Research Laboratory's Gun Dynamics Simulation Codes for Prototype Kinetic Energy, 2003 This report compares a priori gun projectile dynamic simulations to experimental ballistic jump test data for seven 120 mm prototype kinetic energy KE projectiles and describes the methodology used for the comparison The projectiles contain significant differences in their charge subprojectile and sabot designs that span the design parameters encountered in KE cartridge development In such tests four or more sets of orthogonal radiograph images x rays which are typically used to characterize the state of the projectile at muzzle exit can be directly compared to predictions from ARL's gun projectile dynamic simulation GPDS codes The results from these comparisons show that the GPDS codes were able to predict the ballistic experimental results except for the transverse center of gravity jump velocity in two cases For the two cases the difference in predicted and experiment is shown to occur when a high average rate is seen at the muzzle exit and is probably due to the timing error associated with muzzle exit
