Statistical Methods For Eliciting Probability Distributions:

Uncertain Judgements Anthony O'Hagan, Caitlin E. Buck, Alireza Daneshkhan, J. Richard Eiser, Paul H. Garthwaite, David J. Jenkinson, Jeremy E. Oakley, Tim Rakow, 2006-08-30 Elicitation is the process of extracting expert knowledge about some unknown quantity or quantities and formulating that information as a probability distribution Elicitation is important in situations such as modelling the safety of nuclear installations or assessing the risk of terrorist attacks where expert knowledge is essentially the only source of good information It also plays a major role in other contexts by augmenting scarce observational data through the use of Bayesian statistical methods However elicitation is not a simple task and practitioners need to be aware of a wide range of research findings in order to elicit expert judgements accurately and reliably *Uncertain Judgements* introduces the area before guiding the reader through the study of appropriate elicitation methods illustrated by a variety of multi disciplinary examples This is achieved by Presenting a methodological framework for the elicitation of expert knowledge incorporating findings from both statistical and psychological research Detailing techniques for the elicitation of a wide range of standard distributions appropriate to the most common types of quantities Providing a comprehensive review of the available literature and pointing to the best practice methods and future research needs Using examples from many disciplines including statistics psychology engineering and health sciences Including an extensive glossary of statistical and psychological terms An ideal source and guide for statisticians and psychologists with interests in expert judgement or practical applications of Bayesian analysis *Uncertain Judgements* will also benefit decision makers risk analysts engineers and researchers in the medical and social sciences

Subjective Probability Distribution Elicitation in Cost Risk Analysis Lionel A. Galway, 2007 A cost estimate for a project such as the acquisition of a new aircraft or satellite system carries with it an inherent probability that the actual cost will exceed the estimate that changes in requirements technology the economic environment and a multitude of other factors that may occur over the life of the project will change the final cost One major approach to cost risk analysis the evaluating and quantifying of the uncertainty of a cost estimate has been probabilistic expressing the uncertainty in a cost estimate as a probability distribution over a range of potential costs Cost analysts in industry and government and researchers in statistics and management have often proposed that to get probability distributions for platforms using new and untried technologies expert judgment should be tapped and subjective probability distributions elicited from the experts to represent cost uncertainty This technical report reviews procedures for eliciting subjective probability distributions in cost risk analysis both in the cost risk field and in other disciplines in which elicitation has been a topic of research primarily statistics and psychology Because of a lack of empirical work in elicitation especially in cost risk the author also interviewed a number of senior people in the cost risk community who gave insight into the practices of the field This report should be of interest to cost analysis professionals who wish to quantify uncertainty when using expert opinions in cost risk analysis
