**Baroclinic Tides** Vasiliy Vlasenko, Nataliya Stashchuk, Kolumban Hutter, 2005-07-14 This book was first published in 2005 When an oceanic tidal wave that is primarily active on the water surface passes an ocean shelf or a region with a seamount it is split into a less energetic surface wave and other internal modes with different wavelengths and propagation speeds This cascading process from the barotropic tides to the baroclinic components leads to the transformation of tidal energy into turbulence and heat an important process for the dynamics of the lower ocean Baroclinic Tides demonstrates the analytical and numerical methods used to study the generation and evolution of baroclinic tides and by comparison with experiments and observational data shows how to distinguish and interpret internal waves Strongly non linear solitary internal waves which are generated by internal tidal waves at the final stage of their evolution are investigated in detail This book is intended for researchers and graduate students of physical oceanography geophysical fluid dynamics and hydroacoustics

**Oceanic Internal Tides: Observations, Analysis and Modeling** Eugene G. Morozov, 2018-02-08 This book presents a detailed study of the structure and variability of internal tides and their geographical distribution in the ocean Based on experimental analysis of oceanic measurements combined with numerical modeling it offers a comprehensive overview of the internal wave processes around the globe In particular it is based on moored buoys observations in many regions in all oceans Atlantic Pacific Indian Arctic and Southern that have been carried out by researchers from different countries for more than 40 years as part of various oceanographic programs including WOCE and CLIVAR However a significant portion of the data was collected by the author who is a field oceanographer The data was processed and interpreted on the basis of the latest knowledge of internal wave motion The properties of internal waves were analyzed in relation to the bottom topography and mean state of the ocean in specific regions Internal waves play a major role in the formation of seawater stratification and are responsible for the main processes of ocean dynamics such as energy transfer and mixing One of the most significant ideas presented in this book is the generation of internal tides over submarine ridges

Energy fluxes from submarine ridges related to tidal internal waves greatly exceed the fluxes from continental slopes. Submarine ridges form an obstacle to the propagation of tidal currents which can cause the creation of large amplitude internal tides. Energy fluxes from submarine ridges account for approximately one fourth of the total energy dissipation of the barotropic tides. Model simulations and moored measurements have been combined to generate a map of global distribution of internal tide amplitudes. This book is of interest to oceanographers, marine biologists, civil engineers, and scientists working in climate research, fluid mechanics, acoustics, and underwater navigation.

**An Introduction to Tides** Theo Gerkema, 2019-06-20. This textbook is a self-contained introduction to tides that will be useful for courses on tides in oceans and coastal seas at an advanced undergraduate and postgraduate level and will also serve as the go-to book for researchers and coastal engineers needing information about tides. The material covered includes a derivation of the tide-generating potential, a systematic overview of the main lunar periodicities, an intuitive explanation of the origin of the main tidal constituents, basic wave models for tidal propagation (e.g. Kelvin waves, the Taylor problem, shallow water constituents, co-oscillation and resonance, frictional and radiation damping, the vertical structure of tidal currents) and a separate chapter on internal tides which deals with ocean stratification, propagation of internal tides, vertical modes and characteristics, and their generation. Exercises are provided in each chapter.

**Encyclopedia of Modern Coral Reefs** David Hopley, 2010-11-26. Coral reefs are the largest landforms built by plants and animals. Their study therefore incorporates a wide range of disciplines. This encyclopedia approaches coral reefs from an earth science perspective, concentrating especially on modern reefs. Currently coral reefs are under high stress, most prominently from climate change with changes to water temperature, sea level, and ocean acidification, particularly damaging. Modern reefs have evolved through the massive environmental changes of the Quaternary with long periods of exposure during glacially lowered sea level periods and short periods of interglacial growth. The entries in this encyclopedia condense the large amount of work carried out since Charles Darwin first attempted to understand reef evolution. Leading authorities from many countries have contributed to the entries covering areas of geology, geography, and ecology, providing comprehensive access to the most up-to-date research on the structure, form, and processes operating on Quaternary coral reefs.

The AGU Monograph Series on Coastal and Estuarine Regimes provides timely summaries and reviews of major processes and regional studies, both observational and

theoretical and of theoretical and numerical models It grew out of an IAPSO SCOR ECOR working group initiative several years ago intended to enhance scientific communications on this topic The series authors and editors are drawn from the international community The ultimate goal is to stimulate bringing the theory observations and modeling of coastal and estuarine regimes together on the global scale

**Investigation of Baroclinic Tides in the Northern South China Sea**

Chuncheng Guo, 2013 Baroclinic tides result from the interaction of barotropic tides with topography in stratified oceans They play an important role in driving deep ocean mixing In this research investigations of the dynamics of baroclinic tides and internal solitary waves ISWs in the northern South China Sea SCS are conducted mainly by means of the Massachusetts Institute of Technology general circulation model MITgcm Firstly simulations of internal wave generation at the Luzon Strait LS are carried out By conducting three dimensional 3D high resolution experiments it was found that the generated wave field features a multi modal structure large pronounced ISWs of first mode amplitude 120 m and second mode amplitude 120 m were reproduced The two north south aligned ridges in the LS contribute together to the generation of the second mode ISWs whereas the easternmost ridge of the two is responsible for the first mode ISWs It was found that multiple generation mechanisms of internal waves could occur in this region and overall it belongs to a mixed lee wave regime A specific type of short internal waves arose during the 3D simulation These ride on a second mode ISW with similar phase speed trailing a first mode ISW The short waves possess wavelengths of 1.5 km and amplitudes of 20 m and only show up in the upper layer up to a depth of 500 m Scrutiny of the generation process showed that these short waves appear in two distinct regions and are produced due to two mechanisms namely the disintegration of an inclined baroclinic bore near the LS and the overtaking of a second mode ISW in the deep water by a faster first mode ISW Robust evidence has been sought from satellite imagery and by solving the theoretical Taylor Goldstein Equation to verify their existence The effects of superposition of multiple tidal harmonics diurnal and semidiurnal on the resultant ISW generation were investigated It was first found that by analyzing historical observational data the occurrence of ISWs in the far field always follow strong semidiurnal barotropic tidal peaks in the LS regardless of whether it is the maximum for the diurnal or total tidal strength However modelling results of MITgcm and a linear internal tide generation model demonstrate that the diurnal tidal harmonics modulate the arrival time and amplitude of the propagating ISWs Specifically it leads to the emergence of the so called A and B type ISWs and an alternation and transition between the two Secondly the shoaling process of ISWs in the northern SCS slope shelf area is investigated A series of two dimensional 2D experiments are set up to study the shoaling of a large amplitude second mode concave ISW over a linear slope that resembles the SCS slope Modelling results show that a strong transformation of the wave profile starts to take place when the wave is approaching the shelf break A convex type wave is born at the trailing edge of the incident wave and gradually disintegrates into a group of ISWs due to the steepening of the rear wave profile The frontal face of the wave gets flatter when travelling on the slope but forms a steep structure right above the shelf break

However this steep structure shows no tendency to evolve into an ISW instead it gets increasingly flat again while evolving on the shelf The trailing convex wave packet travels faster and merges with the frontal concave wave Finally a wave packet with rank ordered convex ISWs moves forward steadily on the shelf Energy transfer to the ambient modes is evident as both first mode and higher modes are clearly seen during and after the shoaling process First mode ISW evolution is studied too by performing 3D high resolution experiments over the wide northern SCS slope and shelf area It was found that the wave profiles change drastically near the shelf break and the Dongsha Atoll In agreement with satellite imagery the wavefront of the leading ISW becomes more spatially oblique with respect to its original orientation as it progresses westward due to the inclination of the slope in the topography Wave disintegration is prominent in the shallow water zone and wave polarity reverses near the turning point at the 130 m isobath which is consistent with the predictions of weakly nonlinear theory A series of 2D experiments were set up to inspect the effects of rotation on the shoaling ISW The results indicate that under the rotation upon reaching the continental shelf one shoaling ISW could disintegrate into one ISW packet and one secondary solibore that contains a number of rank ordered waves with much shorter wavelength than an ISW The secondary solibore is very pronounced in the northern portion of the northern SCS slope and shelf but could hardly be discerned in the southern portion which is consistent with the outcome of 3D simulations *Meteorological and Geostrophysical Abstracts* ,1997
