Topics in Multidimensional Linear Systems Theory Eva Zerz, 2000-08-16 The past few decades have witnessed an increasing interest in the field of multidimensional systems theory This is concerned with systems whose trajectories depend not on one single variable usually interpreted as time or frequency but on several independent variables such as the coordinates of an image The behavioural approach introduced by J C Willems provides a particularly suitable framework for developing a linear systems theory in several variables The book deals with the classical concepts of autonomy controllability observability and stabilizability All the tests and criteria given are constructive in the sense that algorithmic versions may be implemented in modern computer algebra systems using Gr bner basis techniques There is a close connection between multidimensional systems theory and robust control of one dimensional systems with several uncertain parameters The central link consists in the basic tool of linear fractional transformations The book concludes with examples from the theory of electrical networks

**Design and Implementation of Symbolic Computation Systems** ,1993 *Frequency-Shaped and Observer-Based Discrete-time Sliding Mode Control* Axaykumar Mehta, Bijnan Bandyopadhyay, 2015-01-05 It is well established that the sliding mode control strategy provides an effective and robust method of controlling the deterministic system due to its well known invariance property to a class of bounded disturbance and parameter variations Advances in microcomputer technologies have made digital control increasingly popular among the researchers worldwide And that led to the study of discrete time sliding mode control design and its implementation This brief presents a method for multi rate frequency shaped sliding mode controller design based on switching and non switching type of reaching law In this approach

the frequency dependent compensator dynamics are introduced through a frequency shaped sliding surface by assigning frequency dependent weighing matrices in a linear quadratic regulator LQR design procedure In this way the undesired high frequency dynamics or certain frequency disturbance can be eliminated The states are implicitly obtained by measuring the output at a faster rate than the control It is also known that the vibration control of smart structure is a challenging problem as it has several vibratory modes So the frequency shaping approach is used to suppress the frequency dynamics excited during sliding mode in smart structure The frequency content of the optimal sliding mode is shaped by using a frequency dependent compensator such that a higher gain can be obtained at the resonance frequencies The brief discusses the design methods of the controllers based on the proposed approach for the vibration suppression of the intelligent structure The brief also presents a design of discrete time reduced order observer using the duality to discrete time sliding surface design First the duality between the coefficients of the discrete time reduced order observer and the sliding surface design is established and then the design method for the observer using Riccati equation is explained Using the proposed method the observer for the Power System Stabilizer PSS for Single Machine Infinite Bus SMIB system is designed and the simulation is carried out using the observed states The discrete time sliding mode controller based on the proposed reduced order observer design method is also obtained for a laboratory experimental servo system and verified with the experimental results
