**Complex Variables** Carlos A. Berenstein, Roger Gay, 1991-01      *Several Complex Variables* Hans Grauert, 1976

*Several Complex Variables* H. Grauert, K. Fritzsche, 2012-12-06 The present book grew out of introductory lectures on the theory of functions of several variables. Its intent is to make the reader familiar by the discussion of examples and special cases with the most important branches and methods of this theory among them e.g. the problems of holomorphic continuation, the algebraic treatment of power series, sheaf and cohomology theory and the real methods which stem from elliptic partial differential equations. In the first chapter we begin with the definition of holomorphic functions of several variables, their representation by the Cauchy integral and their power series expansion on Reinhardt domains. It turns out that in contrast to the theory of a single variable for  $n > 1$  with  $G \subset \mathbb{C}^n$  and  $G' \subset G$  such that each function holomorphic in  $G'$  has a continuation on  $G$ . Domains  $G$  for which such a  $G'$  does not exist are called domains of holomorphy. In Chapter 2 we give several characterizations of these domains, the Cartan-Thullen-Levi-Schwarz problem. We finally construct the holomorphic hull  $H(G)$  for each domain  $G$  that is the largest not necessarily schlicht domain over  $\mathbb{C}^n$  into which each function holomorphic on  $G$  can be continued.      *Complex Analysis* Joseph Bak, Donald J.

Newman, 2010-08-02 This unusual and lively textbook offers a clear and intuitive approach to the classical and beautiful theory of complex variables. With very little dependence on advanced concepts from several variable calculus and topology, the text focuses on the authentic complex variable ideas and techniques. Accessible to students at their early stages of mathematical study, this full first year course in complex analysis offers new and interesting motivations for classical results and introduces related topics stressing motivation and technique. Numerous illustrations, examples, and now 300 exercises enrich the text. Students who master this textbook will emerge with an excellent grounding in complex analysis and a solid understanding of its wide applicability.      **Complex Analysis and Differential Equations** Luis Barreira, Claudia

Valls, 2012-04-18 This text provides an accessible, self-contained and rigorous introduction to complex analysis and differential equations. Topics covered include holomorphic functions, Fourier series, ordinary and partial differential equations. The text is divided into two parts: part one focuses on complex analysis and part two on differential equations. Each part can be read independently, so in essence this text offers two books in one. In the second part of the book, some emphasis is given to the application of complex analysis to differential equations. Half of the book consists of approximately 200 worked-out problems carefully prepared for each part of theory, plus 200 exercises of variable levels of difficulty. Tailored to any course giving the first introduction to complex analysis or differential equations, this text assumes only a basic knowledge of linear algebra and differential and integral calculus. Moreover, the large number of examples, worked-out problems, and exercises makes this the ideal book for independent study.      *Complex Analysis* John M. Howie, 2012-12-06 Complex analysis is one of the most attractive of all the core topics in an undergraduate mathematics course. Its importance to applications means that

it can be studied both from a very pure perspective and a very applied perspective This book takes account of these varying needs and backgrounds and provides a self study text for students in mathematics science and engineering Beginning with a summary of what the student needs to know at the outset it covers all the topics likely to feature in a first course in the subject including complex numbers differentiation integration Cauchy's theorem and its consequences Laurent series and the residue theorem applications of contour integration conformal mappings and harmonic functions A brief final chapter explains the Riemann hypothesis the most celebrated of all the unsolved problems in mathematics and ends with a short descriptive account of iteration Julia sets and the Mandelbrot set Clear and careful explanations are backed up with worked examples and more than 100 exercises for which full solutions are provided

subject Each chapter ends with an exercise set Additionally each chapter begins with a prologue introducing the reader to the subject matter that follows capsules presented in each section give perspective and a spirited launch to the segment preludes help put ideas into context Mathematicians and researchers in several applied disciplines will find the breadth and depth of the treatment of the subject highly useful

**Complex Analysis with Applications** Nakhlé H. Asmar, Loukas Grafakos, 2018-10-12 This textbook is intended for a one semester course in complex analysis for upper level undergraduates in mathematics Applications primary motivations for this text are presented hand in hand with theory enabling this text to serve well in courses for students in engineering or applied sciences The overall aim in designing this text is to accommodate students of different mathematical backgrounds and to achieve a balance between presentations of rigorous mathematical proofs and applications The text is adapted to enable maximum flexibility to instructors and to students who may also choose to progress through the material outside of coursework Detailed examples may be covered in one course giving the instructor the option to choose those that are best suited for discussion Examples showcase a variety of problems with completely worked out solutions assisting students in working through the exercises The numerous exercises vary in difficulty from simple applications of formulas to more advanced project type problems Detailed hints accompany the more challenging problems Multi part exercises may be assigned to individual students to groups as projects or serve as further illustrations for the instructor Widely used graphics clarify both concrete and abstract concepts helping students visualize the proofs of many results Freely accessible solutions to every other odd exercise are posted to the book's Springer website Additional solutions for instructors use may be obtained by contacting the authors directly

**Analysis and Geometry in Several Complex Variables** Shiferaw Berhanu, Nordine Mir, Emil J. Straube, 2017-01-17 This volume contains the proceedings of the workshop on Analysis and Geometry in Several Complex Variables held from January 4-8 2015 at Texas A M University at Qatar Doha Qatar This volume covers many topics of current interest in several complex variables CR geometry and the related area of overdetermined systems of complex vector fields as well as emerging trends in these areas Papers feature original research on diverse topics such as the rigidity of CR mappings normal forms in CR geometry the  $\bar{\partial}$  Neumann operator asymptotic expansion of the Bergman kernel and hypoellipticity of complex vector fields Also included are two survey articles on complex Brunn Minkowski theory and the regularity of systems of complex vector fields and their associated Laplacians

*Complex Analysis and Geometry* Pierre Dolbeault, A. Iordan, G. Henkin, H. Skoda, J.-M. Trepreau, 2012-12-06 This meeting has been motivated by two events the 85th birthday of Pierre Lelong and the end of the third year of the European network Complex analysis and analytic geometry from the programme Human Capital and Mobility For the first event Mathematicians from Poland Sweden United States and France whose work is particularly related to the one of P. Lelong have accepted to participate for the second the different teams of the Network sent lecturers to report on their most recent works These teams are from Grenoble Wuppertal Berlin Pisa and Paris VI in fact most of their results

are also related to Lelong's work and a posteriori it is difficult to decide whether a talk is motivated by the first or by the second event. We chose only plenary lectures usually of one hour except a small number given by young mathematicians which have been shorter. A two-hour problem session has been organized. The Proceedings gather papers which are exact texts of the talks or are closely related to them. The members from the Network and five other lecturers sent us papers; the other lecturers published the content of their talks in mathematical journals. All the presented texts have been submitted to referees independent of the organizing committee; the texts of the problems have been approved by their authors.

Complex Analysis Jane P. Gilman, Irwin Kra, Rubi E. Rodriguez, 2007-12-17 Organizing the basic material of complex analysis in a unique manner the authors of this versatile book aim is to present a precise and concise treatment of those parts of complex analysis that should be familiar to every research mathematician.

Complex Analysis and Geometry Filippo Bracci, Jisoo Byun, Hervé Gaussier, Kengo Hirachi, Kang-Tae Kim, Nikolay Shcherbina, 2016-10-23 This volume includes 28 chapters by authors who are leading researchers of the world describing many of the up-to-date aspects in the field of several complex variables SCV. These contributions are based upon their presentations at the 10th Korean Conference on Several Complex Variables KSCV10 held as a satellite conference to the International Congress of Mathematicians ICM 2014 in Seoul, Korea. SCV has been the term for multidimensional complex analysis, one of the central research areas in mathematics. Studies over time have revealed a variety of rich, intriguing new knowledge in complex analysis and geometry of analytic spaces and holomorphic functions which were hidden in the case of complex dimension one. These new theories have significant intersections with algebraic geometry, differential geometry, partial differential equations, dynamics, functional analysis, and operator theory and sheaves and cohomology as well as the traditional analysis of holomorphic functions in all dimensions. This book is suitable for a broad audience of mathematicians at and above the beginning graduate student level. Many chapters pose open-ended problems for further research and one in particular is devoted to problems for future investigations.

**Concise Complex Analysis** Sheng Gong, 2001-03-09 This is a concise textbook of complex analysis for undergraduate and graduate students. It has been written from the viewpoint of modern mathematics: the equation, differential geometry, Lie groups, etc. It contains all the traditional material on complex analysis but many statements and proofs of classical theorems in complex analysis have been made simpler, shorter, and more elegant due to modern mathematical ideas and methods. For example, the Mittag-Leffler theorem is proved by the equation, the Picard theorem is proved using the methods of differential geometry, and so on.

Complex Analysis Teodor Bulboacă, Santosh B. Joshi, Pranay Goswami, 2019-07-08 This book is an in-depth and modern presentation of important classical results in complex analysis and is suitable for a first course on the topic as taught by the authors at several universities. The level of difficulty of the material increases gradually from chapter to chapter and each chapter contains many exercises with solutions and applications of the results with the particular goal of showcasing a variety of solution techniques.

Several Complex Variables V. G. M.
